# POPULAR SCIENCE

**MECHANICS - AUTOS - HOMEBUILDING** 

Here for the first time—Germany's famous SPEKTOSCOPES—a revolutionary concept in binoculars. Wear them like ordinary eye glasses—hour after hour—without fatigue. Feather weight—only 1 az. You'll hardly FEEL them! Yet here is a new, truly powerful optical design that gives you greater range than many expensive opera or field glasses and a far greater field of view than some selling for many times more! Has INDIVIDUAL eye focusing for clear, sharp viewing, whether you're looking at a play in the first row or a seashore scene miles away! SPEKTOSCOPES are ideal for indoors, outdoors or distant scenes or class-by viewing. Special low price—1.98 a saving of \$8.00 or more!

### TRY AT OUR RISK-NO OBLIGATION!

Enjoy at our risk for 5 days. You must be delighted! Otherwise your 1.98 will be refunded with no questions asked! Limited supply forces us to place a limit of 2 per customer. Send check or m.o. for prompt, free delivery. COD's sent plus COD Fees. Use convenient coupon below!

# this coupon

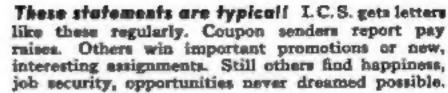

# brings you "good luck"

"Six months after mailing the coupon, I had a promotion and a big raise in pay!"

"From the moment I marked the coupon, my luck changed!"

"My break came when I sent the coupon!"

Is If LUCK? The results are so impressive, so quick in coming, that some say the I.C.S. coupon is "lucky." Of course, that's not true. The real reason for these

amazing results is what happens to the person when he or she mails the coupon.

Cospon is first step! Naturally, you want to make good. But you've put off doing something about it, Mailing this coupon is definite action! It shows you're fed up with waiting for the breaks. You're determined to make your own breaks! And this determination alone accounts for much of the "luck" you'll start to experience.

You get free guidance! Within a few days you get the helpful and inspiring 36-page book, "How to Succeed." It's crammed with information. For example, it tells you in detail how to

plan your career. Also how to prepare for advancement. In addition, you get a free catalog on the LC.S. course that interests you. With your new-found determination and these two books as your guides, you're ready to cash in on your hidden abilities!

391 I.C.S. courses! You'll find a partial list of courses in the coupon below. Each course is up-todate, extremely practical, completely success-tested. You study in your spare time. Set your own pace. Correspond directly with instructors. Cost is low. Diplomas are awarded to graduates. I.C.S. training rates high in all fields of business and industry. You won't find another school like it.

Call it being "lucky" or being "smart," Whatever it is, you're one step closer to your goal when you mail this famous coupon!

# All About Buying Wood

Lumber is what costs you most in any home carpentry or cabinetmaking job. With wood prices up, good shopping can make a difference of many dollars. A special 16-page feature in the September issue will give the low-down on house lumber, plywood, craft woods and moldings. You'll want to save it.

But pictures you ever took

### ... ALL FINISHED IN 60 SECONDS

Snap the shutter, pull a tab, and 60 seconds later lift out a finished picture... the best you ever took. That's what you can do with a Polaroid Land Camera. Every picture you take is a finished picture... ready to see, to show, to mail, to enjoy... just one minute after you snap it.

Free Booklet: "Best Travel Pictures You Ever Took." Helpful and authoritative advice for every picture-taker, no matter what camera you use. For your copy, write: Polaroid Corp., Dept. PS-8, Cambridge 39, Mass.

### THE ALL-STAR PATHFINDER

The aristocrat of Polaroid 60-second cameras. Stop fast action with its high-speed, Rapax shutter (1 to 1/400th second)... bring dimly lit scenes to life with its fast lens (f/4.5)... get hairline sharpness with its Kalart coupled rangefinder... compose the picture accurately with its combination optical and press-type viewfinder... enjoy the sheer magic of 60-second photography.

### THE FAMOUS MODEL 95

The thrifty Polaroid camera that made 60-second photography famous. Here's real simplicity! Easy "drop-in" loading. One dial sets both lens opening and shutter speed. Shutter is self-cocking. Flash pictures are easy, too — with factory-matched flash gun that plugs right into the camera, Takes a big, 3¼" x 4¾" picture, uses same fast film as Polaroid Pathfinder, Truly the "World's Most Exciting Camera,"

POLAROID Land CAMERAS

# Now a new synthetic helps dial telephone service

In a large, modern telephone office, two million relay contacts await the orders of your dial. They open and close a billion times a day.

Unrolled view (reduced size) of capacitar unit wound with "Mylar," The transparent film is only 0.0005" thick yet stands handling without breaking.

Among the elements that guard your dial telephone service are electrical capacitors. They help prevent the formation of arcs that pit and may eventually destroy relay contacts. But millions more of these capacitors are needed each year. How could they be made less costly?

Bell Laboratories engineers, on the lookout for new materials, became alert to the possibilities of the new "Mylar" polyester film. A product of the Du Pont Company, "Mylar" is chemically the same as Du Pont's "Dacron" polyester fiber used to make fabrics. Bell engineers discovered that it also had remarkable dielectric properties—of just the right kind to belp their capacitor problem.

The film takes the place of impregnated paper once used to separate the metal foil electrodes. It is tougher, stands more voltage, needs no impregnation. The new capacitors require no protective housing and are much smaller and less costly.

Here is another example of the way America's technology advances through the sharing of knowledge. Just as Bell Telephone Laboratories makes many of its discoveries—the Transistor, for example—available to other companies, so does it adapt the inventiveness of others when it can help your telephone service.

CONTRACT BARRIES

Improving telephone service for America provides careers for creative men in scientific and technical fields

# This FREE SAMPLE LESSON

will prove you can become an expert

BOOKKEEPER ... ACCOUNTANT

OR C.P.A.

### FREE SAMPLE LESSON

We offer you this free sample lesson so that you can prove to yourself that you CAN master Accountancy—quickly, thoroughly—in space time at home.

You will see exactly how LaSalle's famous "Problem Method" works ... .
how you are led step-bystep through actual accounting work—learning
by doing and not by study
of theory afone. First you
tackle easy problems, then
more difficult oncs—until
soon you master them all.
And at every step you have
the close personal guidance of LaSalle's large staff
of C.P.A. Instructors.

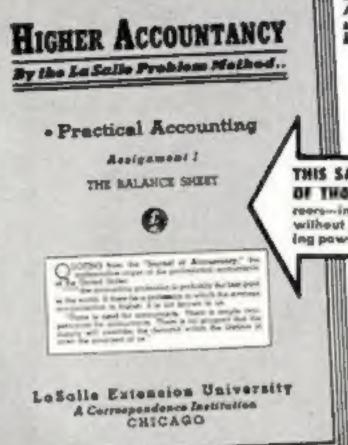

ef all C.P.A.'s
in the U.S. have
been trained by the
LaSalle Problem
Method

### GOOD-PAY JOBS IN 5 BIG FIELDS

If you were an expert accountant right now, chances are you would find yourself among the highest-paid of all professional men and women. Surveys show that accountants earn more than those in other major professions.

There are five hig fields of opportunity open to Accountancy-trained men and women . . . opportunities that are wide open and highly inviting, offering maximum income and job security in good times or bad. And under LaSalle's "Problem Method" you can start earning while still learning—either in spare-time or full-time employment . . . or in business for yourself with no espital required.

Get the latest information by sending for our 48-page book, "Accountancy, the Profession That Pays"... plus free sample lesson. The coupon at right will bring both to you without cost or obligation. LaSaile Extension, 417 S, Dearborn St., Chicago S, Ill.

This well-paid LaSalle-trained Accountant's success could be yours.

THIS SAME LESSON HAS STARTED HUNDREDS

Of THOUSANDS toward well-paid accounting careers—in business, government, and as C.P.A.'s. Even without previous knowledge, progress is rapid—earning power climbs fast. This sample lesson shows why.

If you have been envying the high incomes and good jobs enjoyed by thousands of men and women Accountants today...incomes ranging from \$4,000 to \$10,000 and more per year... why not launch such a career for yourself?

Do you doubt that you can?

Then let us send you—without cost or obligation—the same Lesson Number One with which LaSalle has started several hundred thou-

sand men and women toward successful accounting careers. We want you to see for yourself how this remarkable method, originated by LaSalle, makes Accountancy simple, interesting, practical, and certain . . . how it leads you step-by-step to a complete mastery of Accounting—and on up to the coveted degree of Certified Public Accountant if you so aspire.

It doesn't matter whether you've had previous bookkeeping experience, or whether you don't know a debit from a credit. Whether you wish to qualify as an expert bookkeeper, advanced accountant, cost accountant, auditor, government accountant, income tax specialist, or public accountant... you'll find in LaSalle's Problem Method the exact plan to prepare you rapidly and inexpensively—in spare hours at home—without losing a day from your present job.

So right now, today... if you are an adult, employed, and earnestly ambitious for rapid advancement in this highest-paying of all professions... send your name and address on the coupon below. We'll send the free sample lesson—plus our 48-page book outlining today's career opportunities and how you can qualify for them. A coupon like this has started many thousands toward greater success. It can do the same for you. Mail it today!

# Quietest Tread on Earth... Outgrips, Outwears them all!

 FOUR EXCLUSIVES give you safety, silence, comfort found in no other tire. (1) Interlocking Safety Tread for greater "hold" in all directions. (2) Silent Traction Design cancels out hum and sing for world's quietest ride. (3) Intra-Tread Bumpers hold tread ribs apart ... muffle squeal. (4) Uni-Cushion Contour-more rubber on road for smoother riding, longer wear.

> Mokers of Armstrong Pure Foom Cushiening

## Unconditionally Guaranteed 3 Years!

Unserviceable tire will be replaced by comparable new tire with full credit for the period of guarantee not realized.

ARMSTRONG BUSBER COMPANY, West Haven 16, Com., Norwalk, Conn., Notches, Miss., Des Moines, lawa, 601 Second Street, San Francisco, Calif. Export Division: 20 East 50th Street, New York 22, N.Y.

### Relativity on the Highway

Your articles on autos give data on piston travel in feet per car mile at 20 m.p.h. Isn't the piston travel per car mile the same, regardless of car speed? COURTLANDT W. BABCOCK, Brookline, Mass.

The reason for specifying piston travel at a particular speed is the expansion of tires caused by centrifugal force. If the diameter of a tire increases as little as % inch at, say, 70 miles an hour, a 24-inch wheel will make eight fewer revolutions a mile than it would make at 20 miles an hour. The fewer wheel revolutions, of course, the fewer engine revolutions.

### **Helicopter Fire Engine**

The recent collision of two tankers in the Delaware River, and the resultant fire. brings to mind a suggestion.

In this case, as in many ship fires, the fire fighters were dependent either on equipment on board the burning ships themselves or on the appearance of a fireboat,

Why not have a method of fire fighting

from the air?

My suggestion is for a specially equipped helicopter or an auxiliary piece of fire-fighting equipment that any helicopter could carry in an emergency. It would include a tank of CO2 or some approved fire-fighting chemical that could be sprayed from a fog nozzle from above to blanket the fire. This would at least help to keep the fire in check

# How To Stumble Upon A Fortune in G

All over the U.S. — Diamonds, Pearls, Amethysts, Opals, Garnets, Jade, Rubies, Topaz, Sapphires, Turquoise, Zircons, and other Precious and Semi-Precious Stones are Walting to be Picked Up!...

IF TOU FOUND THIS

IN TOUR BACKTARD

(as Non P. Jones

Would Yell know it was a \$4 is farat Diamond

(see story at left)

### Here is Exactly HOW and WHERE to Find Them...

Next time you trip on a rock -examine it carefully You may have "wa.ked into" a real fortune unexpectedly.

Last year alone, over half a MILLION dollars worth of stones were found by week-end gem hunters. A youth pitching horseshoes in an open lot picked. up a stone and kept it in his pocket for 15 years before he discovered it was the largest alluvial diamond ever found in the U S A. ... 34 46 carate in weight.

Two salesmen went gemhunting on vacation and found a small pocket of "Tourmaline," a semi-precious, crystal gernstone, worth \$13,500.

### Are You "Passing Up" Real GEMS Near Your Home?

Valuable gems are all around us -half hidden by surface dirt and other rock Perhaps in an abandoned quarry near your home, a river hottom, a rocky hillside, a beach, or an old cave. If you know WHERE to look and how to RECOGNIZE the more precious stones you can enjoy an educational hobby that can pay off BIG.

Now you can enjoy and profit by gemhunting—no matter where you live in

the U.S. Brand-new book, "Gem Hunter's Gorde" tells all you need to know. Exactly where

to find scores of precious and semiprecious gems Where to find rich

PEARL-bearing mussels. Complete town-by-town and gem-by-gem cross-index helps you plan week end and one-day gem hunts. How to recognize each variety... clear photos of gems in their natural state make it easy. Simple tests you can give the rocks you find, plus 1,350 locations where gem matemais have been found all over I'S A and a special chap-

ter on how to identify quickly 69 different and valuable gematone varieties. Book is handsomery bound, contains over 200 pages packed with illustrations, photos, maps, etc.

Examine FREE For 5 Days

SEND NO MONEY Just fill out and mail the coupon below. We wallsend the Gem-Hunter a traide for you to examine Free for 6 days entirely at our own risk and expense If you decide to buy the book t may be the richest investment you ever made. In a s nate day, it may pay you back many thousands of times its small. cost So rush coupon NOW for 5 days' FREE examination in your own home.

### Wanted: Dirt from All Over

I have been assigned, as a school project, to make a large map of the United States and Alaska during the summer months. It would be of more than usual interest if it were possible to obtain a bit of soil from each state and Alaska to put on the map.

Since it would be too costly and impossible for me to travel enough in three months to cover the United States, I thought perhaps someone in each state and Alaska might like to do me a favor by sending a bit of their soil my way. It would take only

a teaspoonful, which could easily be sent in an envelope. A level teaspoon would require only 3¢ postage, even from Alaska.

PAUL D. EAVES, 746 First Ave., Gadsden, Ala.

### Against Rear Engines

I'd like to get into the argument over rear-engine cars, on the negative side:

It is not true that the present-day car is nose-heavy—the weight is almost equally shared by the front and rear wheels. This is due to the fact that the engine and transmission are placed slightly to the rear of the front wheels. Also, the differential helps halance the weight distribution, the ideal condition being slightly more weight over the driving wheels.

However, in rear-engme construction the engine has to be behind or directly above the rear wheels to allow for a back seat. That means the weight of the engine, transmission and differential all are borne by the rear wheels, hence increased tendency to skid

and maybe a need for dual wheels,

The popular European rear-engine cars are small and have light engines—some aircooled to decrease the concentration of weight at the rear. They also have spare

- New-formula grooming aid gives heir naturally-neater look without goosy grease or cream!
- Removes flaky dandruff...
   makes scalp feel better, more refreshed!

Whether you go hatless or not, keep hair neatly groomed all day the way so many outdoor men do—with Fitch Ideal!

See the neatest trick of all—as Ideal's secret grooming agent...not a grease, oil nor cream...makes thin hair look thicker—thick hair stay slicker!

Ideal also relieves dry, itchy scalp—also removes loose dandruff—while it works its grooming miracles!

Feel its new tonic action. Feel your scalp tingle with invigorating freshness! Note—there's no lingering, tell-tale odor!

Start tomorrow. Just seconds—massaging hair and scalp with a dash of new Fitch Ideal—will pay off all day! You can count on Fitch Ideal for that smart, naturally-nester look of the man who's going places! At all drug counters—also ask Barbers for professional applications.

Get new

FITCH Ideal HAIR TONIC

wheels, gas tank and sometimes the battery moved to the front to help distribute the weight more evenly. This leaves little or no convenient space for luggage. Until lightalloy engines are produced equaling today's standards, the rear-engine family car is only a dream.

STAN THACKER, Victoria, B.C., Canada

### Midnight Ride

After enjoying the science-fiction story in the June issue, "Islands in the Sky," I turned to the announcement of the Model T Contest. That night I had a peculiar dream: I dreamt I climbed into my Model T And took off for a trip to the Moon; I visited Venus and Mercury, Jupiter, Mars and Neptune.

At a breath-taking pace I toured outer space, Skimmed the Milky Way flying quite blind; I challenged a rocket to a one-sided race, And left it 10 light-years behind.

The music of the spheres was sweet to my cars.

Combined with the Tin Lizzy's din, Till my gas ran low, then a tire had to blow, And I realized the spot I was in.

If she started to stall—what a terrible full! I nearly got nervous prostration,

But it turned out okay Just a million miles

Was the Mercury service station.

As I chugged through the night, spacemen cheered my strange flight.

With no hint of scorn or derision:

For my journey afar, I had picked the right

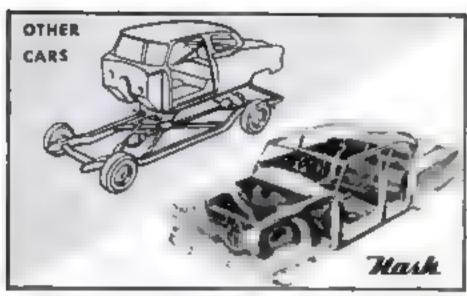

With a planetary transmission!
SYLVESTER McLeon, Forest Hills, N.Y.

### **Better Read This Slowly**

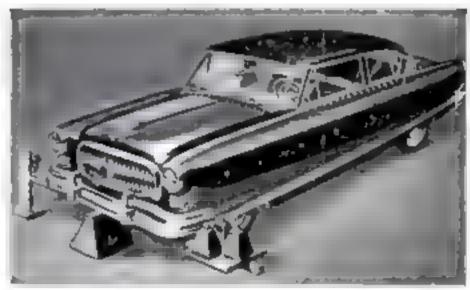

One of your recent issues infers that Rolls-Royce has the only transmission allowing a one-gear upshift, a two-gear upshift and a three-gear upshift. Although the Dual Range Hydramatic infers two options, there are actually three options. In the low range the transmission shifts once, in the second range it shifts twice, and in the third range it

# Do You Know?

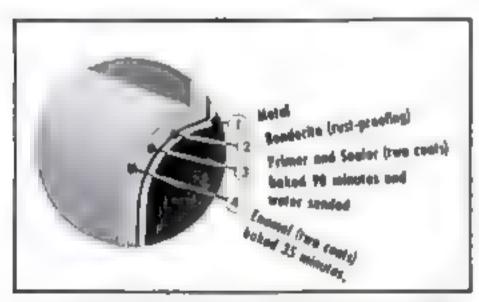

# Why Nash Automobiles Stay New Years Longer?

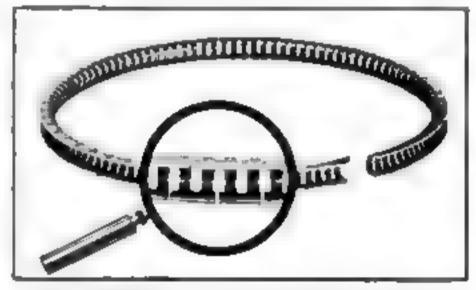

Ordinary cars have separate frame and body bolted together, which tend to loosen from road shocks and vibration, enusing squeaks and rattles. In Nash Artifyte Construction, body and frame are welded into one unit that stays light as new years longer.

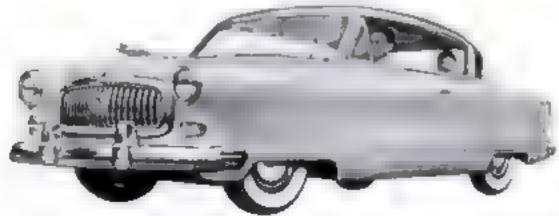

Secontific tests show Nash Auflyte Construction has twice the torsional strength (reasturee to twisting of ordinary design—with greater life-saying strength surrounding the passenger compartment—strength that adds many miles to the life of a Nash.

To preserve the beauty of the baked enamel finish, all Nash cars are treated with Bonderite. This process provides an anchor for the finish, retards rust, cracking, chapping or peeling of the hard enamel—insures lasting beauty.

The "U-Flex" of control ring, shown above, is typical of the many ndvanced engineering features found in all Nash engines. The slotted design meters a controlled quantity of mi and numbers uniform pressure. Uses less oil, increases engine life.

Nash cars are designed and built to remain new years longer. See and drive the new 1958 Nash Airflytes, Ambassador, Statesman, Rambler, styled by Pinin Farina, at your Nash dealer's. You'll find there are—

None So New As That Airflytes

### Naighbers Praise His Articles

As a 'buy-product' of my N.S.A. Training, I have received a lotal of \$73.00 for articles and material from Autobody and the Reconditioned Co. The local weekly City and Suburban Life, printed one priticle and miked for more. When neighbors stop you on the street to say 11., Laurel Gardens, Pennsylvania.

# Why Can't You Write?

It's much simpler than you think!

So MANY people with the series which is a first the they set up imaginary barriers to taking the first step-Many are convinced the field is confined to persons gifted with a genius for writing

hew realise that the great hulk of commercial writing is done by su-called unknowns. Not only do these thouand, of men and women produce most of the fiction pub-Inshed, but countless articles on science, current events, business, sports, hobbies, travel, local, church and club activities, etc., as well.

Such material is in constant demand. Every week thousands of checks for \$25, \$50 and \$100 go out to writers

whose latent ability was perhaps no greater than yours

### The Practical Method

Newspaper work demonstrates that the way to learn to write is by writing' Newspaper copy desk editors waste no time on theories or ancient classics. The story is the thing, Every copy 'cub' goes through the course of practical criticism—a training that turns out more successful authors than any other experience.

That is why Newspaper Institute of America bases its writing instruction on the Copy Desk Method It starts and keeps you writing in your own home, on your own time. And upon the very same kind of actual assignments given daily to metropolitan reporters. Thus you learn by doing not by studying the individual styles of model authors.

Each week your work is analyzed constructively by practical writers. Gradually they help to clarify your own distinctive style, Writing soon becomes easy, absorbing. Profitable, too, as you gain the "professional" touch that gets your material accepted by editors. Above all. you can see constant progress week by week as your faults are corrected and your writing ability grows,

### Have You Natural Ability?

One IREE Willing Springle Levi wid reveal whether or the took have material alent or werence. shifts through all four gears. Low range keeps the transmission in second, the socalled "dual range" allows keeping the transmission in third, and the high range permits a shift to fourth range.

ELDEN D. JONES, Riverside, Calif.

### Concrete Pitfalls

I found your May article on the \$300 swimming pool quite interesting but I believe, as an engineer, that a few words of caution should be given to anyone attempting a similar feat. There are many pitfalls in concrete construction and it would be too had to see \$300 and 118 man-hours fall into one of these.

Concrete which is fust a guesswork mixture of cement, aggregate and a random amount of water will not stand the ravages of time and climate. An immense amount of research has been done to discover how to make durable, leakproof concrete. Information is obtainable free of charge from the Portland Cement Association, whose sole interest is to prevent botched-up jobs giving concrete a bad name.

WILLIAM F. SAUNDERS, St. LOUIS, MO.

### Disposable Sun Lenses

I would like you to inform H. Gage of S. Chatham, Mass., that the "disposable sun lens," which he suggested in your "I'd Like To See Them Make" department in June, can be purchased in the form of automobilewindshield glare shields.

I purchased a pair of these green plastic glare shields for 29¢. When cut out to fit my glasses, they made 24 pairs of removable plastic lenses that may be stuck on by first blowing my breath on the glasses. They are casily removed and may be used many times. Cheap too.

KEN LANDIS, Neffsville, Pa.

### Market for a Model A

Your series of articles on the Model T Ford, leading to your current contest, is fine. My own interest, however, lies with a latermodel Ford: the Model A, years 1930-'31. I would like to get hold of a touring car of that vintage in rebuildable condition.

I have pretty well covered Connecticut in my search for such a car, with no success. I would appreciate hearing from anyone in this section of the country who might be able to guide me to one.

ROGER W. KNIGHT, R.F.D. 2, West Simsbury, Conn.

# INVENTORS

Learn how to protect your invention. The U. S. Patent Laws provide that any new and useful art, machine, article of manufacture, or composition of matter, or any new and useful improvement thereof, may be patented if the act of invention is involved. Therefore, every inventor with a valuable invention should take advantage of the Patent Laws and proceed for patent protection in order to safeguard his rights.

A patent gives the inventor the exclusive right to prevent others from making, using, or selling the invention claimed in the patent for a period of seventeen years.

The Patent Laws were enacted for the benefit of the inventor to give him protection for the features of his invention which are patentable. These features must be properly and concisely set forth and claimed in a formal application for patent, in order to comply with the requirements of the Patent Laws. For that reason, unless the inventor is familiar with patent matters, he should engage a competent registered patent attorney or agent to represent him. We are registered to practice before the U. S. Patent Office and are prepared to serve you in the handling of your patent matters.

A specially prepared booklet entitled "Patent Guide for the Inventor", containing detailed information with respect to patent protection and procedure, together with a "Record of Invention" form will be promptly forwarded to you without obligation upon request.

# INVENTORS

If you believe that you have an invention, you should find out how to protect it. The first step is to have a search made of the prior pertinent U. S. patents. If a report on this search indicates that the invention appears patentable you can apply for a patent, and the specifications and claims should be prepared.

The firm of McMorrow, Berman & Davidson, with offices in Washington, D. C., is qualified to take the necessary steps for you. We can make a preliminary search on your invention, advise you whether we think it can be patented, and prepare your application for

patent.

Unless you are fully familiar with the U. S. Patent Laws, we recommend that you engage the services of a Registered Patent Attorney to protect your interests. The patent laws are your laws. A patent gives you the right to prevent others from making, using or selling the invention claimed in your patent for a period of 17 years.

Use these patent laws for your protection. Investigate whether your invention can be patented. If you have what you believe to be an invention, we suggest that you have this firm make a search for you.

Send for a copy of our Patent Booklet entitled "How To Protect Your Invention," containing information about patent protection and patent procedure. Along with this we will also send you an "Invention Record" form, for your use in writing down and sketching details of your invention. We will mail them promptly. No obligation. They are yours for the asking.

# You Can Influence Others With Your Thinking

TRY IT SOME TIME. Concentrate intently upon another person seated in a room with you, without his noticing it. Observe him gradually become restless and finally turn and look in your direction. Simple—yet it is a positive demonstration that thought generates a mental energy which can be projected from your mind to the consciousness of another. Do you restize how much of your success and happiness in life depend upon your influencing others? Is it not important to you to have others understand your point of view — to be receptive to your proposals?

How many times have you wished there were some way you could impress enother favorably — get across to him or her your ideas? That thoughts can be transmitted, received, and understood by others is now

scientifically demonstrable.

### This FREE Book Points the Way

The tales of miraculous accomplishments of mind by the ancients are now known to be fact—not fable. The method whereby these things can be INTENTIONALLY, not accidentally, accomplished has been a secret long cherished by the Rosicrucians—one of the achools of ancient wisdom existing throughout the world. Write for the free copy of the fascinating sealed book, "THE MASTERY OF LIFE," which explains how you may receive this unique wisdom and benefit by its application. Address: Scribe X.N.M.

# INVENTORS

I shall be pleased to furnish you, upon request, with information relative to patent procedure—without any obligation on your part.

PATRICK D. BEAVERS

Registered Patent Attorney

957 Columbian Building, Wathington 1, D. C.

# Inventors

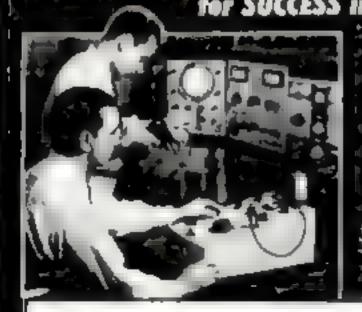

The following are the usual preliminary steps to take toward patent protection.

Make a disclosure of your invention; sign, date and have this document witnessed by two or more people who understand your invention; authorize your registered patent attorney or agent to conduct a preliminary search among previously granted U. S. patents for similar types of invention; secure a report on the probable patentability of your invention and a recommendation of the further course to take,

We shall be gled to send you without obligation our instructive beaklet, "Peront Protection for Inventors" and our "Evidence of Invention" disclosure force.

THE NEW MODEL TV-TT

# EST

. Uses the new salf-cleaning Lever Action Switches for individual element testing Bacause all elements are numbered according to pin-number in the RMA base numbering system, the user can instantly identify which element is under test Tubes having tapped filmments and tubes with filaments terminating in more than one pin are truly tested with the Model TV-II as any of the pins may be placed in the neutral position when necessary

The Model TV-11 does not use any combination type sockets. Instead individual sockets are used for each type of tube. Thus it is impossible to damage a tube by inserting it in the wrong socket.

Pres-moving built-in roll chart provides complete data for all tubes.

Phono Jack on front panel for plugging in either phones or external amplifier will detect microphonic tubes or noise due to faulty elements and loose external connections.

Operates en 105-130 Volt 60 Cycles \$ A C. Hand-rubbed oak cobinet camplete with portable cover.

# KIDNEYS MUST REMOVE EXCESS WASTE

Nagging backache, loss of pep and energy, beadaches and distincts may be due to slowdown of kidney function. Doctors any good kidney function is very important to good health. When some everyday condition, such as stress and strain, causes this important function to slow down, many folks suffer nagging backache—feel miserable. Minor hadder irritations due to cold or wrong diet may cause getting up nights or frequent passages.

Don't neglect your kidneys if these conditions bother you. Try Doan's Pills—a mild diuretic. Used successfully by millions for over 50 years. It's amazing how many times Doan's give happy relief from these discomforts—help the 15 miles of kidney tubes and filters flushout waste, Get Doan's Pills today!

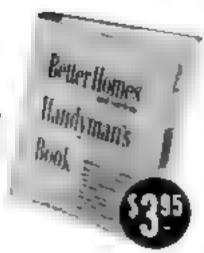

BE YOUR OWN BOSS! Men who are determined to get ahead in something for themselves will find this opportunity hard to beat! Where else can a man turn his own labor so quickly and easily into BIG MONEY! Earn as high as \$50 and more a day sanding floors with an easy-to-run American Machine—and YOU ARE BOSS. Prospects everywhere—old and new homes and remodeling. Pleasant indoor work—steady the year round. No schooling—no experience needed. Age makes no difference—men 18 to 80 are active and successful. Send coupon for "money-making" bookler entitled "Opportunities in Floor Surfacing"—enclose 25c in coin or stamps to cover handling.

SIMPLE CLAMP ATTACHES TO MOLDING OF ONE OR TWO FIECE WINDSHIELD

P.O. Box 246-E& WARREN, OHIO

Clumsy, unsightly "robbit nors" or other "Metallic Monsters" -Bivered pictures with phoets, double images and flickers.

## The Modern Bestenna Way

Requisful leather-like and that lies flat on self-Clear, sharp pictures with one twist of the tuning knob

# CLEARER, SHARPER RECEPTION

The scientific wonder of printed circuits in the Bestenna guarantees you far better reception than is possible with any ether indoor antenna or ghost eliminater forget about double images, blurs, ghosts and flickers

# LIES FLAT ON SET

The Besteans actually looks like a custom made desk pad [151/2" equare)-with a tuning knob added. Gold embassed simulated leather and velve) bellom Lamps of vases can be placed on top of it, since it is waterproof, atom and boot resistant.

# **EXCELLENT RECEPTION ON ALL** CHANNELS, INCLUDING UHF

The extented tuning mechanism is completely directional This means that it electron cally tunes the orienna to the exact direction from which each station telecosts. Your TV set receives stronger signals from every channel. You II get bright, clear pictures an ALL channels, and this all modern antenna was designed to include reception of the new UNF stations new being planned 5 mply turn the knob until you see the clearest, sharpest picture)

NO INSTALLATION FEES! NOTHING TO ASSEMBLES NO EXTRAS TO BUY! ATTACHES IN 30 SECONDS!

## H. SEARS CO.

Dept. B-6, 799 Broadway New York 3, N. Y.

# Restore Full-Power to your Ford

Insist on Genuine Ford Distributor Points. The contacts are made of pure tungsten . . . to exact Ford tolerances. They help give your Ford new-car power.

Mighty small, aren't they? Yet if these tiny Distributor Points are worn or faulty, your engine may misfire or not run at all. You see, they help build up the spark that sets fire to the gas in your engine. Every mile you travel, they make contact 12,000 times—around 120 million times in an average year's driving!

Pure fungsten is about the only metal that can stand up under this wear and tear . . . and also conduct the high voltage (15,000 volts) necessary to operate your Ford's ignition system. And you can be sure that you're getting *pure* tungsten points when you ask for Genuine Ford Distributor Points.

# KEEP YOUR FORD ALL FORDI

Available at all Ford Dealers and selected independent garages where you see this ugn.

You can be sure, too that all Genuine Ford ignition parts are made right to work right to last longer in your Ford. They're designed to work together. And they're track tested and proved by Ford engineers to make sure they're right before being approved for manufacture.

# He Recaptures Captures Capture

"Flying by the seat of his pants" in old-type crate is fun and relaxation for pilot of giant airliner.

# By Wesley S. Griswold

IN LAKEVILLE, Minnesota, people look up at the sky when they hear what sounds like an outboard motor running at full throttle. A 1911-model

yellow airplane is likely to come sailing over the trees, bouncing and fishtailing in the invisible billows of the air like a big box kite

When a control-tower operator at a nearby airport first saw this strange

SOMETHING HAS SEEN ADDED to the original Curtiss design, which afforded no instru-

ments at all. The wheel and chain came from a crashed twin-engine Army Beech.

FOR SAFETY'S SAKE, Captain Bullock wires cap screws on plane's gasoline gauge. Note or

scoops on engine. He found them necessary even though engine is fully exposed.

his harn workshop, where taptam Bullock built the wings for his Curties and also constructed all the cabinets for his farmhouse.

THE RACING GRANDPA, as the press called Bullock when he entered the 1946 Bendix Race, points out brake pedals to two of his three grandsons. Big pedals control the rudder.

# "It Looks Mighty Unsafe," Says Mrs. Bullock

craft moving towards hun, he shouted over the public-address system, "Take to the hills, men! Here come the Wright brothers."

The Wright brothers, however, wouldn't have been caught dead in this plane. It was designed by Glenn H. Curtiss, at a time when he was their bitter rival.

Now the plane belongs to Capt. Walter R. Bullock, of Northwest Airlines, a tall, rugged man of 53 with ruddy face, blue eyes and graying hair, whose portrait is one of 10 in U. S. Aviation's Hall of Fame in Washington.

Bullock's flying machine is a copy of a Curtiss pusher that he owned as a teen-ager. He made it out of secondhand parts from several modern airplanes and wings that he built in his barn workshop at Lakeville.

## Recaptures Original Thrills

This summer, with old rivalries long forgotten, Bullock's Curtiss will take part in the nation's observance of the fiftieth anniversary of the Wright brothers' first flight.

Captain Bullock, who has about 24,000 hours of flying to his credit, regularly pilots a Boeing Stratocruiser between Minneapolis and Seattle. At the
end of each homeward flight, he descends from that mammoth, 130,000pound airliner and usually heads for his
Lakeville farm and the 600-pound Curtiss. In it, all alone on a canvas seat out
in front of the wings, he recaptures the
original thrills and real fun of flying.

It's an enthusiasm that Mrs. Bullock emphatically doesn't share. Her husband literally flew into her life, one February day in 1922, when he made a forced landing on her father's Wisconsin farm. She would prefer that he not fly out of it.

"When he's up in that pusher," she says, "all I can think of is that he's sitting in a little chair a thousand feet above

ROUTINE BULLOCK FLIGHT is shown in series of photos above (top to bottom). Starting the hard way, spinning the pusher prop by hand. Ready to roll, he fastens safety belt. Airborne in 100 feet, he then soars over the trees. A perfect landing ends the flight.

Pilot Bullock poses in Curties biplane beside the hig Stratocruiser he flies for a living.

my head. . . . It looks mighty unsafe."
Bullock is inclined to pooh-pooh the hazards. The plane, powered by a 75-horsepower Continental aircraft engine with a pusher propeller, takes off in 200 feet or less, and he can set it down on almost any clear and reasonably flat surface. Its stalling speed is a gentle 38 miles on hour.

# Have to Fly It Every Second

He has flown the pusher for nearly 60 hours since he finished it, and he probably would have flown it a good bit more if it were not for the fact that his life insurance becomes null and void while he's up in the plane. The Curtiss is licensed as experimental, and Bullock's policies don't cover participation in such shenanigans.

"The plane bandles easily," he says, "though I don't suppose you could exactly call it stable. You have to fly it every second, It's so slow that gusts of wind make it lose a lot of flying speed. If the gusts come too often, it tends to settle, and I have a devil of a time keeping it in the air. But it sure is fun. Boy, you can see so much!"

Bullock, a Minneapolis boy whose father was a strokbroker, caught the flying fever early. He built models of Wright, Curtiss and Langley planes when he was a schoolboy, When he started in carnest to reproduce one of them full-scale in the back yard, his parents sent him to the Curtiss company's flying school at Newport News, Va. There, in the late fall of 1916, after 486 minutes of instruction at 81 a minute, he became, at 17, the youngest licensed pilot in the U.S.

In honor of this event, his indulgent father planked down \$900 for a semi-wrecked 1911 Curtiss pusher and presented it to him. Walt rebuilt it, under Curtiss supervision, and even learned to loop it.

To Bullock's deep regret, he didn't get to fly during World War I, when he enlisted in the Army. Once out of uniform, however, he started barnstorming around the country in a series of Curtiss Jennies.

## Ran Flying School

During the early Twenties, Bullock ran a flying school in Minneapolis, and on weekends took curious hangers-on up for short flights at \$25 a head. In 1927 he became a pilot for Northwest Airlines, a year after the company was formed, and is today its most distinguished captain.

During World War II, Bullock did valuable icing research for the Army Air Forces, and was among several vet-

[Continued on page 222]

# Come On In, Mom —the Paper's Fine

THAT's right, Mom and the kids are wearing bathing suits of paper that won't tear even when wet. The suits were made to show the ruggedness of paper coated with Melostrength, a resin developed from melamine by American Cyanamid, In tests, a wet, inch-wide strip of coated paper supported a 13-pound block of concrete and a treated freezer-pack paper was boiled continuously for 72 hours without disintegrating.

▶▶▶With a new kind of sunglasses you can look at a red light and see red, or walk over green grass and see green. Colors are as true as when viewed with the naked eye, except that they appear less intense due to the filtering effect. Yet the neutral gray lenses absorb all but 15 percent of the sun's light, including the ultraviolet rays that tire the eyes most when the day is spent outdoors. The Ray-Ban glasses were originally developed for the Navy but now are available to civilians. Bausch & Lomb makes them.

# Barbecue Cooks Meat Sideways

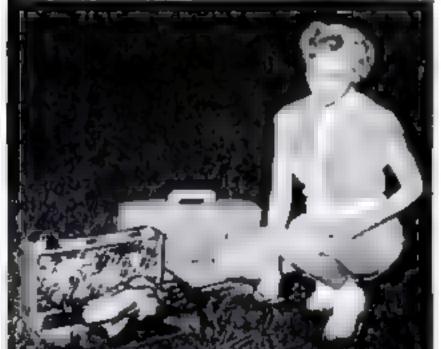

Hene's a portable barbecue grill with a vertical firehox that holds the charcoal in place behind a mesh wall. Cooking juices drip into a saucepan instead of into the fire so they can be used for basting the meat or preparing gravy.

The drip pan also catches grease splashes that might burn the chef or cause a sudden flare-up of the fire. The Bar-B-Grill is made by May & Scofield, Howell, Mich., and sells

THE hull of the Paragon Express 21, below, is without a seam from gunwale to gunwale. Along with the trunk cabin, canopy and transom, it's made of molded plywood. She's the first inboard cruiser with this type of construction—which never requires caulking or preswelling and resists worms and dry rot, according to the Paragon Marine Construction Co., of North Miami Beach, Fla. The craft's 60-horse Chris-Craft drives her at 20 miles an hour

# Hero's Medal Honors Miner Who Saved Pal

His bravery cheated death as explosion blasted their underground coal room

HIS companion was unconscious when Dwight Knupp came to in the black, smoke-filled, fume-choked pit 450 feet underground. What happened is shown in these sketches of the drama that earned the 33-year-old coal miner a 1953 Medal of Honor of the Holmes Safety Association.

1 the TIPPLE of the Acosta-Gray No. 3 Mine, the scene of the drama, towers skyward on the fringe of the little mine patch of Gray, Pa. The town got its name from the fact that at one time the houses, then company-owned, were all painted gray.

2 DWIGHT KNUPP leaves his home near Boswell, Pa., early Monday morning, March 24, 1952. He mines coal to support a wife, and nine children ranging from two to 13. 3 THE DAY SHIFT converges on the tipple, 3 lanch pads in hand, Knupp, for right, hurries to catch up with Lawrence Geisbert, also east for a key role in the day's disaster.

4 AT THE BOTTOM of the 300-foot mine shaft, the two men hop aboard one of a string of cars called "mantrips" when hauling men.

5 AT THE END of a two-mile trip they are 450 feet underground. Now they crawl several hundred feet to reach their work location.

70 POPULAR SCIENCE

6 HEADWAY in the workroom is only 36 inches. Knupp starts to shovel coal as Geisbert turns on electric mining machine.

7 EXPLOSION of methane gas is set off by a spark. Both men are knocked unconscious. Smoke and fumes fill the room.

B FIRST TO RECOVER is Knupp. Although budly burned and bruised, he gropes around and finds his companion. Geisbert, more seriously injured, is unable to move.

9 KNUPP, realizing that they can't live long amid the fumes, lifts Geisbert. Tugging, drugging, he gets his much heavier friend onto a conveyor and starts the controls.

10 At WORKROOM HEADING, other miners load the two injured men on a mantrip and push them to the mineshaft elevator.

11 AMBULANCE RIPE to hospital is last lap.
Mine experts say Geisbert would not have lived 10 minutes in explosion room.

#### Plastic Lifeline Can't Sink

MADE of lighter-thanwater polyethelene, a new type of heaving line is taking the place of vegetable-fiber ropes as lifeboat equipment. Because it is nonabsorbent it will float indefinitely. It is extremely elastic, and its glass-like sheen makes it easy to see, as shown in the Esso Otlways photo at right. American Manufacturing Co., which makes one-inch Floaterope, beheves that larger sizes may become popular as light towing lines.

#### Mighty Mite Dons Water Wings

THE Marine Corps' Mighty Mite has added swimming to its land and airlift feats (PSM, June '53, p. 88).

Flotation gear consists of four rubber tubes which can be attached to the car and inflated from the engine's exhaust. Churning wheels propel and steer the Mighty Mite, which has a top cruising speed of a little more than two miles an hour.

#### Float Ring for Young Bathers Has Retractable Head Grip

Easy to store and simple to inflate, a new vinylite plastic swim ring has a head section recessed at its center which inflates with the rest of the ring and is then passed through it to form a handhold for young navigators.

Repeated flexing of the plastic causes no cracks or tears, and the soft surface resists salt water and wear by gritty sand. Donut Duck can be purchased for \$1 at department and specialty stores.

## Big-Scale Designs for A-Power Revealed

From industry's drawing boards come bold new ways for mighty electric generating stations to harness the atom.

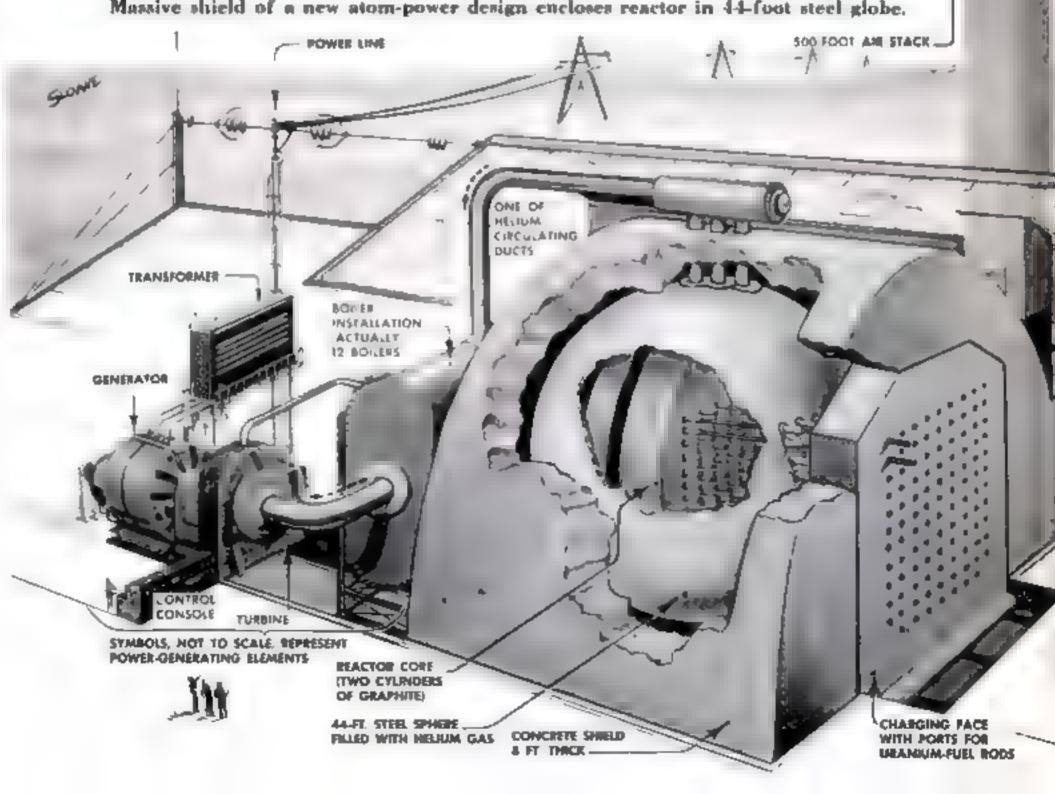

#### By Alden P. Armagnac

IT/ANT a preview of the atomic-power station that may light your home some day?

A scale model demonstrates a pilot-size plant that can be built right now for \$10,000,000. So says North American Aviation, Inc., which designed it for the U.S. Atomic Energy Commission. Heat from a uranium-fueled atomic furnace, conveyed by liquid metal to an underground boiler room, makes steam to run a turbogenerator yielding 8,000 kilowatts-enough for 2,000 average homes.

Meanwhile engineers of leading U. S. electric and chemical companies, aided by the AEC, have been working since 1951 on designs for really bigscale future A-power plants. A recent AEC report reveals what's cooking. Arched like a huge air-raid shelter, a concrete shield surrounds a 44-foot

Massive shield of a new atom-power design encloses reactor in 44-foot steel globe.

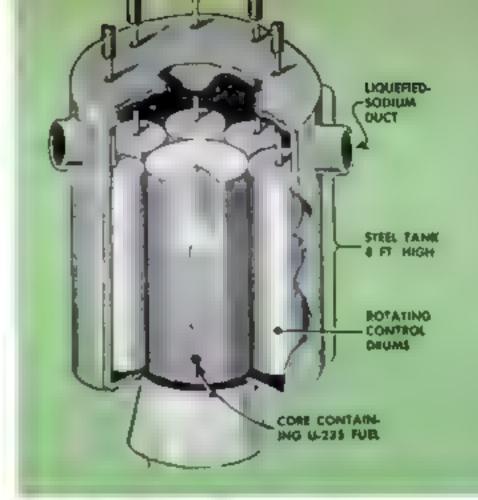

SMALLEST OF DESIGNS, 8,000-kilowatt pilot plant, is no pygmy. Reactor compares in heat output with Brookhaven pile, most powerful for which figures are public.

PIONEER ATOMIC-POWER BOILER, designed at Argonne National Laboratory, now harnesses Experimental Breeder Reactor at Arco, Idaho, Liquid metal heats it to make steam.

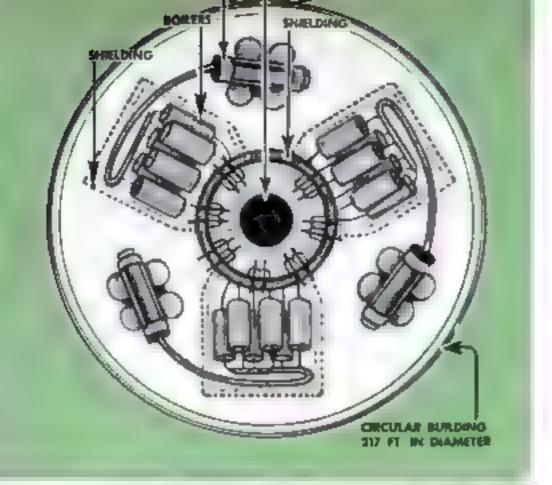

A MIGHTY MIDGET, this proposed reactor has core only 38 inches high, but could spin turbine generating 154,000 kilowatts. It burns concentrated U-235, has novel controls.

steel globe containing a graphite-uranium reactor, in a design by a Commonwealth Edison Co.-Public Service Co, of Northern Illinois engineering team. A 500-foot-high stack, venting heated air from within the shield, causes inward suction that prevents escape of airborne radioactivity into the building. Pressurized helium gas carries the reactor's heat to boilers, whose steam drives a 60,000-kw. turbogenerator. Net power, after deducting what the plant itself consumes, amounts to 46,000 kilowatts. This plant would cost \$40,000,000.

Another design by the same team proposes a heavy water-uranium reactor in a 20-foot globe. The heavy water carries heat to hoilers for steam-making. This plant has three 80,000-kw, turbogenerators and a net output of 211,500 kilowatts. It could be built for \$118,000,000.

An octagonal graphite-and-enricheduranium reactor, nearly 90 feet in maximum diameter and 30 feet high, is envisioned in a Monsanto Chemical Co.-Union Electric Co. design. Liquid metal, a sodium alloy of low melting point, transfers heat. Three or more turbogenerators deliver up to 554,000 kilowatts net. It would cost \$61,000,000.

A midget reactor in a steel cylinder

CIRCULAR ATOMIC-POWER PLANT, with boilers and turbines grouped around reactor in 20-foot globe, is one of big-scale designs on drawing boards of U.S. power companies.

only eight feet tall and wide spins a great 154,000-kw, turbine, in a Pacific Gas & Electric Co.-Bechtel Corp. design, and yields 145,000 kilowatts net. This souped-up or "fast" reactor burns highly concentrated fuel—fissionable uranium-235—in a cylindrical core 38 inches high and broad.

Surrounding drums, a novel means of control, may be rotated. To fan the nuclear fire, they bring neutron-reflecting material near it. To check it, they present a neutron-absorbing blanket of uranium, whose U-235 content has been removed or spent as fuel. Then the reactor, acting as a "breeder," makes new fuel by turning the depleted uranium into fissionable plutonium. Liquefied sodium collects heat for the power plant. This attractive little number has a \$51,000,000 price tag.

Molten fuel feeds a uranium-235 reactor in a power plant of up to 138,000 kilowatts, so radical in atomic engineering that final design and cost are still to be worked out by its Dow Chemical Co.-Detroit Edison Co. sponsors. A tremendous advantage of its fluid fuel would be the ease of reconditioning it for re-use.

Ultimate objective is a reactor whose core is a potful of molten fuel, almost at red heat. Possibilities for the fusible

fuel include a uranium alloy, a uranium salt, or solid fuel particles suspended in a metal of lower melting point. Matching one with reactor materials that can withstand its heat is no small problem. So a modified, more immediately realizable design would be developed first. Uranium-alloy fuel flows in and out in the molten state, but solidifies briefly in the core, easing heat-resisting problems there.

This mobile-fuel reactor would be of the breeder type. Its intense heat would raise liquid metal to 1,020°F., for making steam and power with high efficiency.

This veritable atomic blowtorch would undergo first trials on a lake ship or barge, moored or sunk well offshore to safeguard a locality's inhabitants.

A cool million dollars already backs the promise of this forward-looking design. The Dow-Detroit Edison group has put up \$275,000 to develop it, and AEC laboratories are expending \$725,000 in supporting research.

Buoyant enough to stay at the surface, one-man submarine is shown ready for an ocean dive.

WEARING DIVING LUNG and face mask, pilot sits in a plastic-covered cockpit that fills with water when the minisub is launched. He can remain submerged for an hour.

CANOFY has been removed to show working parts of "bathtub" submarine. (a-inventor Gongwer has left hand on control stick. Up front are foot pedals and chain-drive.

JULES VERNE, with all his imagination, never dreamed of taking a bathtub to sea as a submarine. But that is just about what two young California engineers have done with their unique, one-man, leg-

powered "minisub."

The 145-pound, eight-and-a-half-footlong craft is made of glass fibers and has a plastic cockpit bubble over the skipper's seat. Since the minisub, when launched, sinks and fills with water, leaving only the bubble above the surface, the pilot wears a compressed-air diving lung and face mask (July, p. 160). Bicycle pedals chain-power small, aircraft-type propellers, and a single control stick operates fore and aft fin surfaces for diving and underwater maneuvers, including loops.

The little sub's builders, C. A. Gongwer and G. M. McRoberts of the Aerojet General Corp., claim that it slips through the water with one-third less resistance than a man swimming. Speed, they say, is about four miles an hour. They expect to up that by installing a battery-operated electric motor. Then they hope to put the minisub on the market for about \$1,500

If you are economy-minded but still want to explore the ocean bottom at ease, the two inventors have an underwater bike. It's not

so fancy, but better than swimming.

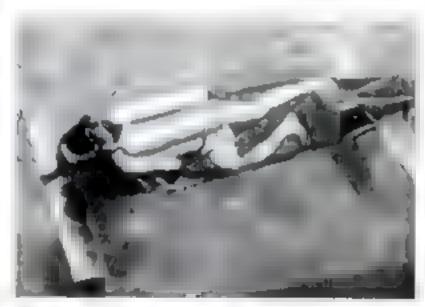

ALUMINUM PROP BLADES rotate in opposite directions to counteract torque. With installation of half-horsepower electric motor, inventors say tiny sub will do eight m.p.h.

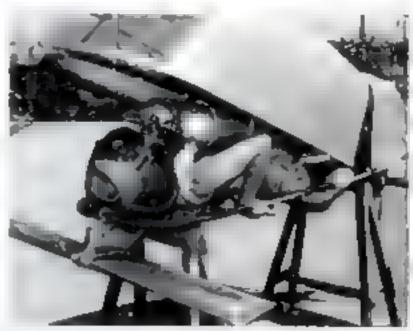

#### From These Trial Jobs Came the One-Man Sub

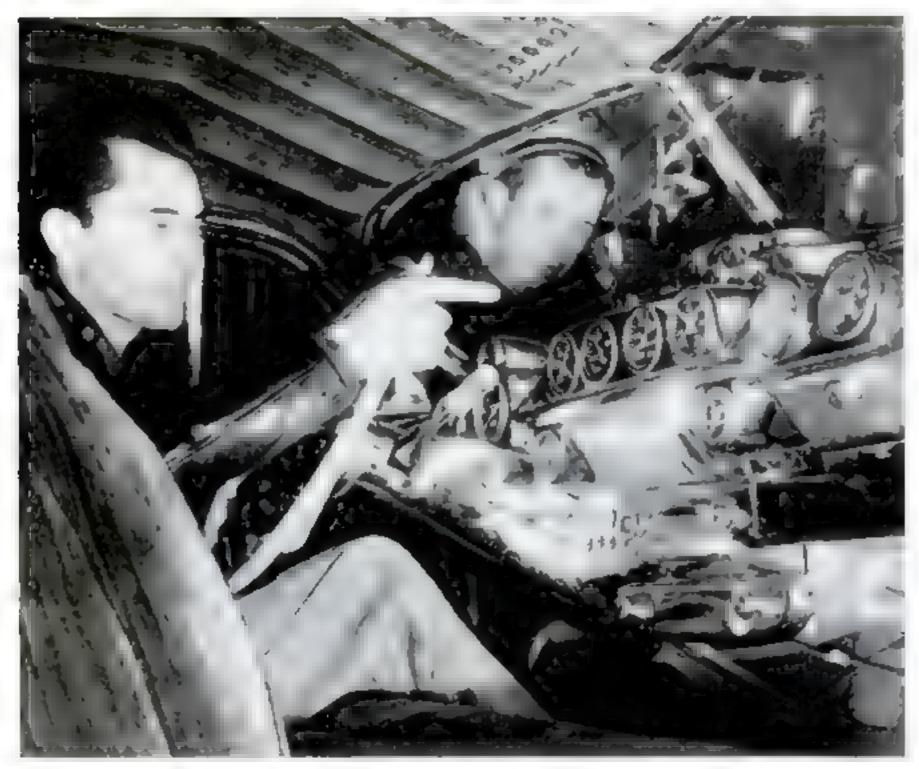

IN THIS EARLY MODEL, operator stretched out prone on stick and rested shoulders in curved metal pieces seen at upper right.

RAT SOARO has now replaced slender stick. Control fine are aluminum instead of wood; are tanks have been added.

CANOPY gives streamlining and submarine look, but operator still lies flat in this version. It had a similar bottom fairing.

#### Automobile's Instrument Panel Looks Like Spaceship's

Joe Banon's '41 Chevrolet has enough dials (15 of them) and push buttons (32) to run a spaceship. Tools for road repairs are eached in the door panels and the tailpipes are recessed in the rear bumper.

A Haywood, Calif, car enthusiast, Bailon paid \$50 for the car as a wreck five years ago then put in thousands improving it. To date, he has walked off with 19 cups in custom competition.

#### German Truck Turns Into a Portable Milking Machine . . .

Instead of driving the cows to the milking machine, why not drive the milking maclane to the cows? You can do just that with this three-wheeled truck, made by the Gohath Works in Germany. A vacuum pump is driven by the engine to power eight milking machines. With the milkers removed, the car can be used for other jobs.

#### Police Call In Via Radiophone

A HANDLE-TALKIE in this call box gives police more scope. In an emergency, it can be lifted out and run on batteries to keep a roving patrolman in constant touch with the station. Motorola designed the system

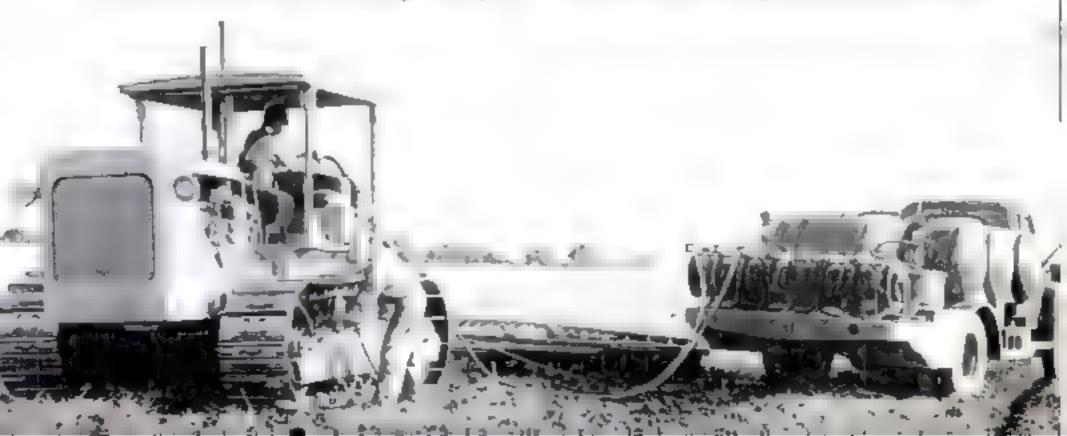

#### How to Get Fed by Infrared

Thus gal is frying an egg over a 1,550watt infrared lamp. The gold-lined, tough glass bulb won't break even if ice water is poured on its hot surface. Sylvania makes the bulb, Sears, Roebuck sells the stove.

#### ... And a Farm Truck Becomes a Rolling Service Station

ALEX METZLER, a California farmer who works 5,000 acres, decided to do something about the time wasted driving equipment back to the barn for servicing. His port-

able service station is shown below greasing a tractor. Large tanks on the Ford dispense gas, diesel oil and water. Small ones hold air, motor oil, grease and brake fluid.

# The Toughest Peaks Are Still Untouched

Everest is climbed—but the cloud-capped summits of giants yet unconquered still challenge the adventurous mountaineer.

#### By Gardner Soule

"THERE is no end," said George Leigh-Mallory, "to this kingdom of adventure."

When he said it, Mallory, a great British mountaineer, had a chance to climb Mount Everest, and what he meant was that reaching the summit would in no sense end the tasks ahead of explorers.

Mallory himself in 1924 climbed closer to Everest's peak than anyone before him. He was last seen heading upward with a companion when a cloud closed down and blotted out his fate forever.

To this day no one knows whether

Mallory and his teammate, Andy Irvine, did climb Everest. But in May 1953, two other men—a beekeeper named Edmond P. Hillary, from New Zealand, and a Nepalese named Tensing Norkay, reached the summit of the highest mountain.

And their achievement, great as the world acknowledges it to be, by no means ends what Mallory called the "kingdom of adventure."

Instead, ahead of mountaineers and explorers—today's climber is usually a combination of both—lie such glittering goals as they never have had before. This is partly because constant exploration locates new mountains, partly be-

TOUGHER THAN EVEREST, many tuineers have judged, is K-2, world's second tallest peak at 28,250 feet. It's in the Karakoranis, Kashmir. Summit pyramid is continuous rock-and-ice climb for two and a half miles. U.S. team under Dr. Charles Houston is trying it (PSM, July, Page 70).

THIRD BIGGEST after Everest and K-2 is Kanchenjunga (28,166 feet), 45 miles from Darjeeling, India. Climbers have struggled for days to cross its long ice ridge, sleeping in ice caves. They have even tunneled through some barriers. But storms and avalanches that hard down icebergs have kept it unclimbed.

cause new methods like ski-equipped airplanes bring inaccessible places into reach, partly because the feats of men like Hillary and Tensing spur on others.

The barest handful of the world's unclimbed peaks are shown in the photos.

Mountaineers avoid comparisons, yet it looks as if many of these and some other summits will offer difficulties even greater than did Mount Everest. Men since 1922 have thought they knew a way to the summit of Everest. Many mountains even today have revealed no path to their peaks.

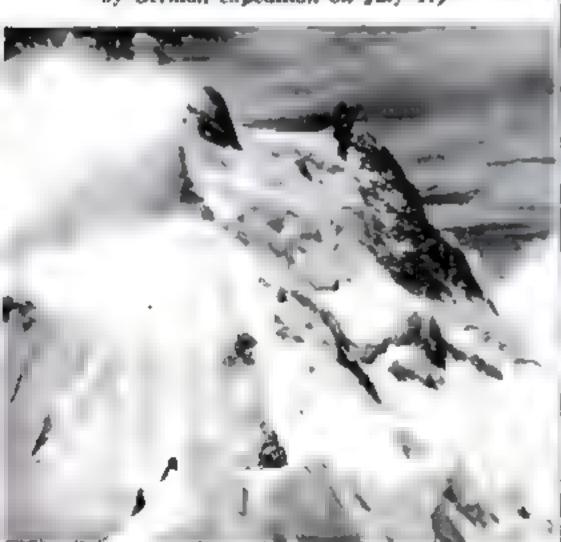

Still others, all over the world, are in areas so rugged they are not even approached. An example of one such mountain was Annapurna, climbed in 1951 by France's Maurice Herzog. Herzog and his party were the first white men to get within 50 miles of Annapurna,

in Nepal.

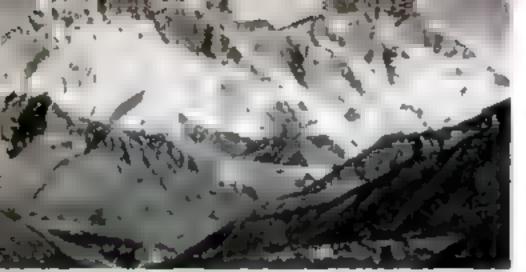

The other day in New York City,

UNATTEMPTED Paiju, in Pakistan's Karakoram range, frightening and impossible as it looks, is nevertheless only average in difficulty for the Karakorams. "I doubt it'll ever be climbed," says Wood, Photo will give you an idea of appearance of a mountain so discouraging that mountaineers don't even attempt it.

NAKED MOUNTAIN Nanga Parbat, north of Kashmir, is most murderous of all. 31 men died in first four attempts on summit. In 1937, last attempt before one currently being made by Germans, an ice avalanche buried 16 men. (Editor's note: Nanga Parbat icas conquered by German expedition on July 4!)

THIN AIR stop unclimbed 27,890-foot Lhotse (right), world's fourth highest peak, may be attempted by mountaineers. Photo was made on 1950 U.S. expedition that opened route used by British thin year to climb Everest (center).

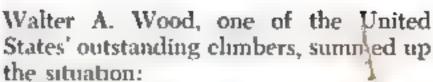

Storm Stort Las "Mount Cook" (center), says Wood, "has not been climbed, It's on the Alaska-Canada border. You can see one reason in photo: those clouds, They're a storm coming from the Pacific."

ARCTICICEBOX "Here," said Walter ARCTICICEBOX Wood, "take your pick, You are fooking across the Upper Seward Clacier, northwest Canada. None of these has been climbed." Permanent snow and ice are chief hazards on arctic climbs.

QUESTION MARKS Uncertain as to will present are mountains of New Zealand's Takahe Valley, whose frozen take and "snow grass" are shown in mid-winter (August). The area has just been opened to climbers.

"What's left for the mountameer? What's gone, you mean," he said. 'After all, what peaks have been climbed? Duly a little of the highest cream has been skimmed off."

Wood himself has more first ascents to his credit than most climbers, in the arctic and sub-arctic of Alaska and Canada. He was first up Mounts Steele. Wood, Walsh, Hubbard, Alverstone. The heights of these range from 14,500 (Alverstone) to 16,439 feet (Steele).

"After all," he said, "the only ranges where you will find more peaks climbed than unclimbed are in Europe, New Zealand, and the western U.S.

"What remains now is most all of the mountains in most all of the world's great ranges. Even if every expedition in the field this year is successful, this would still be overwhelmingly true. Most high mountains are untouched.

"Mountaineers have work to do from the bottom of the earth up. The antarctic is studded with mountains. With the exception of a few close to the sea, none has been climbed

"In Africa—in the Ruwenzori and Kenya ranges and others—many summits are unreached.

"Farther north still, I don't remember any reports that any of the Kamchatkas in eastern Siberia have been climbed.

"I could go on all day," he said.

He did go on long enough to mention all the places shown in the photographs.

"The climbing of Mount Everest," Wood said, "is in no sense any kind of end to mountaineering. It's the beginning."

RAIN—5 DAYS OF 7 "In the southern Andes of South America," says Wood, "only half a dozen peaks have been climbed." Near Straits of Magellan (photo), the Andes rise, full of ice-fields. It rains there 250 days a year.

#### **Pillow Pad Cools** Harried Sleepers

KEEP a cool head and vou'll be cool all over, say physiologists. To help you do just that when you're trying to eateh some shut-eye on hot nights the Chillory (right) was invented. A plastic pad with molded-in channels, it fits under the pillowease. A tiny electric pump circulates water through the pad and back to the pump where it starts its cooling journey all over agam. On torrid nights ice cubes can be added to the water, Jet-Heet, Inc., 152 South Van Brunt St., Englewood, N.J., makes the pad for about \$20.

#### Trunk Reefer Cools Motorists

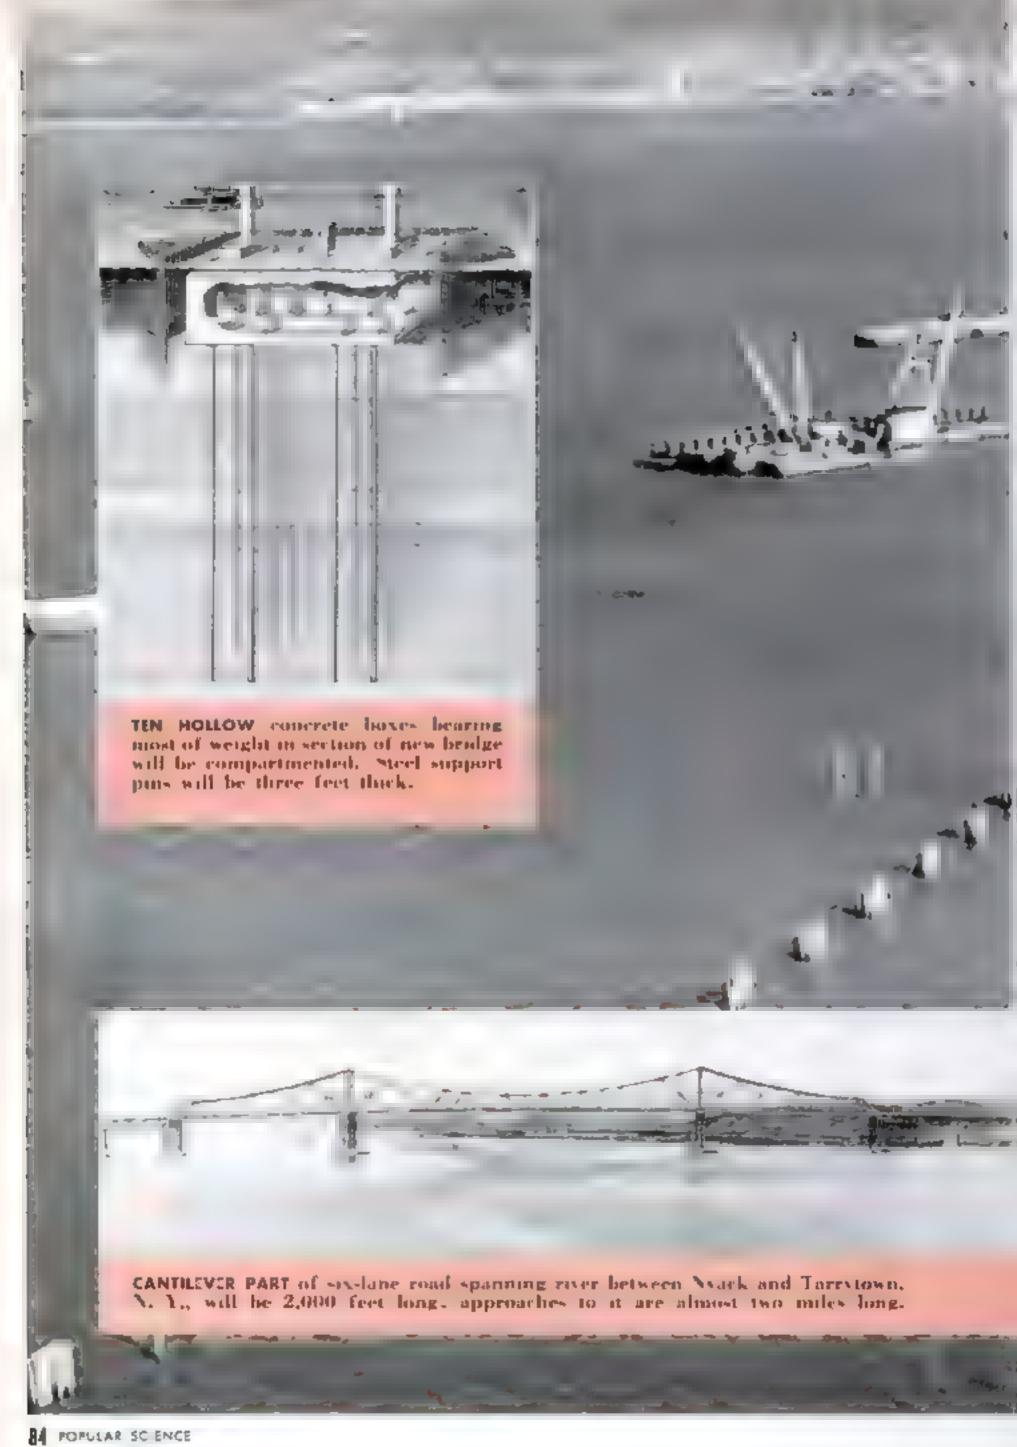

DEATH VALLEY driving can be as bracing as a spin along the Alaska Highway when you twist the dials of an all-car air conditioner now being offered for 6- and 12-volt electric systems. Developed by Bill Lind, Fort Worth manufacturer, and veteran race driver Babe Stapp, Refrigair (below) consists of a compressor and condenser, mounted under the hood, and a Freon cooler which slides into the trunk.

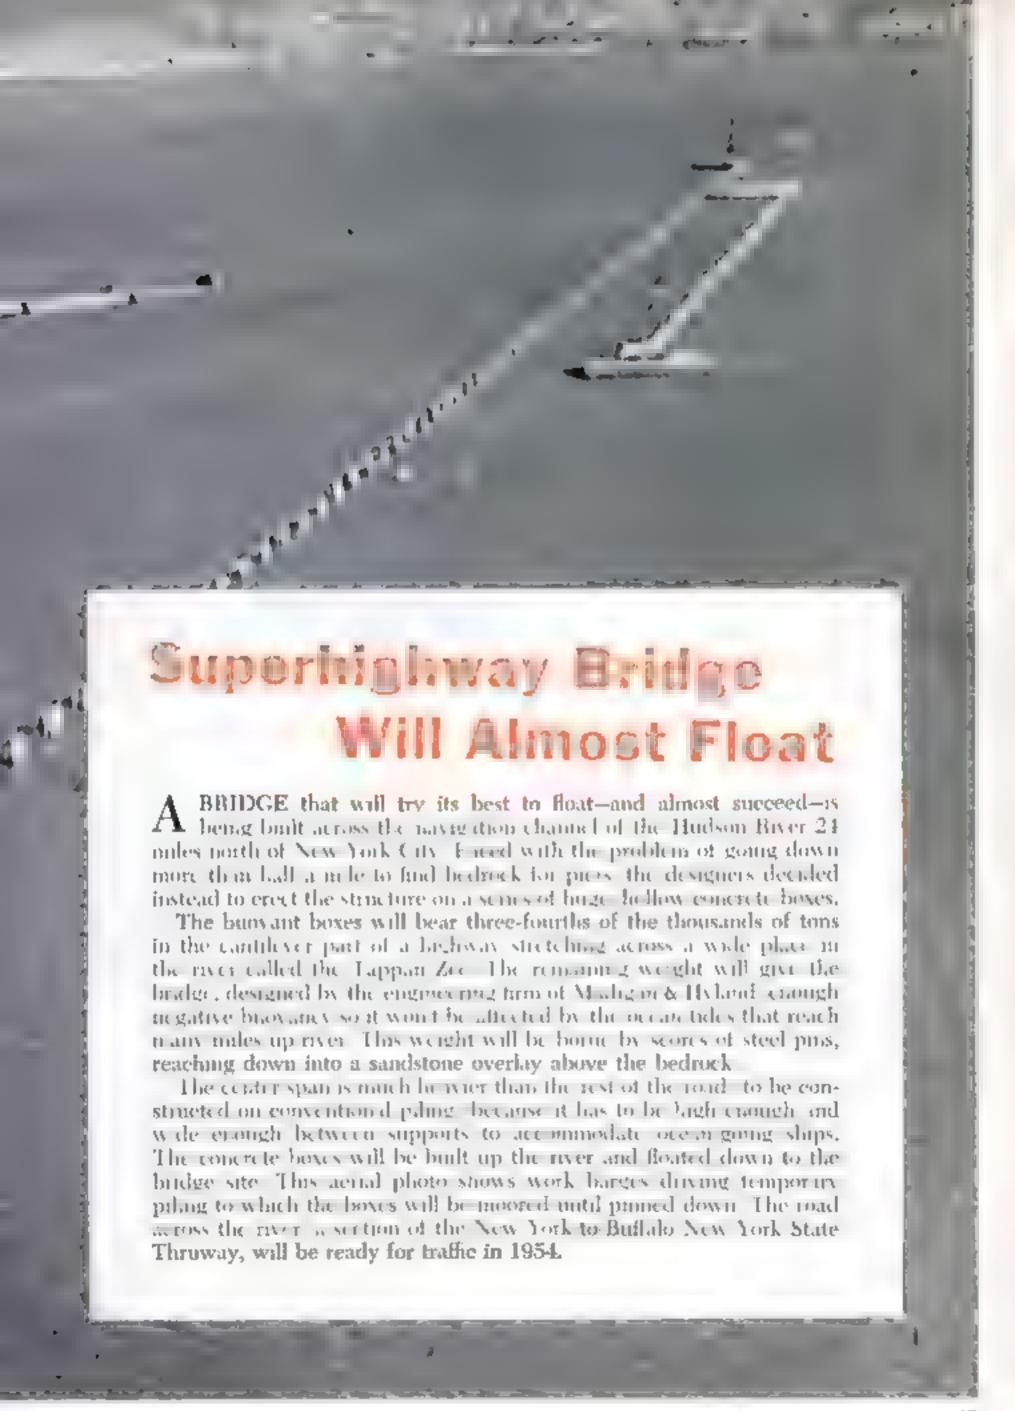

#### Air Suit Cools Pilots

Titus flying union suit has a built-in airconditioning system. Air fed through sewnin piping cools your skin. The R.A.F. developed the suit, worn under overalls, to save the weight of machinery needed to cool cockpits so pilots don't fry.

#### World's Fastest Piston Airliner, DC-7, Flies at 365 M.P.H.

THE Douglas DC-7, capable of toting 96 passengers at 365 miles an hour, will begin flying the major U.S. airline routes this year It's the world's fastest commercial piston

airliner. The cabin is pressurized for sealevel comfort up to 12,500 feet. The new plane can fly a distance of more than 4,400 miles nonstop.

#### Aluminum Trailer Opens Up into Tent with Double-Sized Bed

One minute after the owner of a new kind of trailer-tent spots a place to camp, he can be all set for the night. That's how fast the tent can be put up. It repacks in a minute too.

A lightweight aluminum trailer holds the tent, such camping necessities as skillets and fishing rods, and a bed wide enough for two and long enough for a six-footer. When not used for camping, the trailer will serve as a general haulage cart on the farm or at a summer cabin.

TRAILER PACKS 500-pound load on single wheel, Vehicle's empty weight is 200 pounds. It is made by Heilite Trailers, Lodi, Calif.

OPEN FOR CAMPIAG, tent is supported by crossbar on two stakes. Canvas floor is in-

tegral. Bed has an air mattress. Storage compartment doors open at both sides of trailer.

# A New Magic Bullet Cures an Old Disease

The microscope revealed a swarm of squirming, corkscrew-shaped organisms . . . One shot of Bicillin, a long-acting form of penicillin, stops syphilis in the early stages, thus simplifying an ancient, difficult war.

#### By John Pfeiffer

A 20-YEAR-OLD Chicago garage mechanic shifted in his chair while a doctor examined a sample of his blood serum. He wasn't sure about the nature of his infection. But the doctor had no doubts. The microscope revealed a swarm of the squirming, corkscrew-shaped organisms called Spirochaeta pallida that cause syphilis.

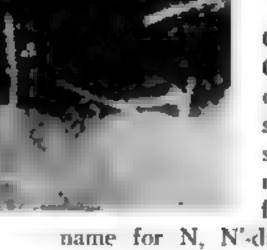

So, about a sixth of an ounce of milky white fluid, a bit more than a teaspoonful, was injected into his hip muscle. When the youth's blood was examined six hours later the

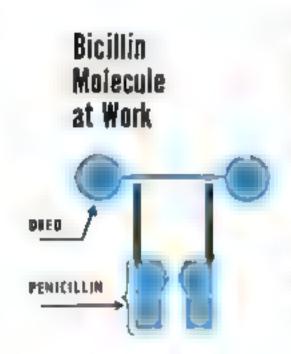

spirochetes had vanished and they haven't been seen since—after more than 16 months of regular observations.

This story is among the records of Chicago's Municipal Social Hygiene Chnic. Not long ago it would have been dismissed as science fiction of the wildest sort. But the patient's treatment represents a recent and significant development. He was given a new long-acting form of penicillin known as Bicillin (trade

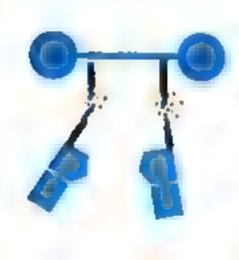

name for N, N'-dibenzylethylenediamine dipenicillin G, if you must know). The drug may mark the end of a search which started more than half a century ago for a one-shot "magic bullet" to cure early syphilis.

Preliminary results are encouraging. U.S. Public Health

Body fluids

penicultin
in blood,

Service experts have been directing a broad experimental program at clinics in Durham. N. C., St. Louis and New Orleans as well as Chicago. They've treated nearly 200 patients. Some 125 early cases have been followed for six months or more, 23 for over a year. And cure rates are about 95 percent!

Treatment of syphilis has previously called for a series of injections, and people don't look forward to being stuck with hypodermic needles. (Pills cannot be used, because stomach acids destroy anti-syphilis drugs too quickly.) Furthermore, many patients still do not realize that the untreated disease may lead to fatal heart or brain disease. They start but never finish treatments—and act as dangerous "carriers," spreading the disease to others.

Ten years ago, a single-injection syphilis treatment ranked high on the list of medical daydreams, together with such items as baldness cures, wrinkle-removers, and elixirs of youth

#### Treatment Used to Call for 70 to 80 Shots of "606"

Syphilis spirochetes were properly regarded as tough customers. Their name is Greek for "pale, coiled hair." The microbes not only look like corkscrews, they behave that way. They rear up to their full height (1/3,000 of an inch), spin rapidly, and start boring. Soap and water will easily kill their within an hour, the time they take to penetrate the skin. But special measures are required after the organisms go underground.

For many years doctors prescribed arsenic-containing substances, modified versions of the famous "606" or Salvarsan discovered by Ehrlich back in 1909, Sufferers were supposed to receive 70 to 80 injections, one injection a week, and some schedules called for several hundred shots over a period of three or four years.

The big breakthrough came when penicillin was first used in treating syphilis. The mold extract was safe. It killed spirochetes by the millions, as long as enough of it remained in the blood stream. It was excreted in three hours or so, however, and that meant an average of eight injections a day. A course of treatment usually required up to 80 injections, But at least the ordeal was over in about 10 days instead of 18 months or more.

Doctors then developed ways of prolonging the effects of penicilin and reducing the number of shots. Until recently the best preparation was "PAM"—penicilin in peanut oil combined with aluminum monostearate, a fatty substance alhed to fabric-waterproofing agents. There's a familiar theory behind the brewing of this strange concoction. Drink-

ing a glass of milk is good insurance it you're easily affected by highballs or cocktails. You'll probably have less trouble because alcohol passes slowly into the blood through the milkfat barrier in your stomach. The fat oil combination in PAM has a similar effect. It coats the penicillin with a kind of

capsule, forming a depot or reservoir in the body. The antibiotic seeps through the capsule fairly slowly and the body receives a steady supply for 72 to 96 hours. Three shots of this preparation administered over a period of eight to 10 days, is a recommended treatment.

Now even this tremendous advance is topped with the coming of Bicillin.

Dr. Joseph Seifert, a tall energetic investigator with a crew-style haircut, is chiefly responsible for the discovery of

this new drug. He is head of the biochemical research laboratories of Wyeth Incorporated, a Philadelphia pharmaceutical firm—and doesn't rate as an expert on syphilis. He isn't even interested in the fine points of medical practice; he'd rather talk about the basic workings of the body, or the details of a new drug molecule.

The new anti-syphilis drug is a custom-built molecule. If a Bicillin molecule were magnified a few billion times, you would see a weird-looking structure about the size of a child's bicycle. The main part would have a long, dumbbell shape. Attached to the "bar" of this framework would be two smaller pieces looking something like tiles: a pair of penicillin particles.

The dumbbell part of the molecule—a substance identified

by the letters DBED—is a black sheep in an illustrious drug family whose most respected members are standard remedies for hay fever and colds, the antihistamines. By itself, this substance is worthless as a remedy, a fact which Dr Seifert learned after conducting a series of futile tests more than seven years ago.

The Philadelphia researcher forgot about those tests until a hot August day when he was lunching with a group of colleagues. He was sleepy and wasn't

following the conversation too closely. Suddenly he heard something said about DBED forming an extra-strong chemical bond with peniculin. "I sat up and told them this might be the clue to a long-acting penicillin. We started work."

Tests answered a good many questions about DBED

#### **Barber Chair Is Streamlined**

RAZOR-WIELDING inventor George Parker claims his new all-upholstered barber chair is the first really new kind in 62 years. That's how long it has taken to break away from pipe-and-casting models. His Pasadena, Calif., clients call his design a "clipper-chair"

#### Plastic Tubes "Sip" Cups

Brown through transparent Tenite tubes, waxed-paper drinking cups make a santary trip from forming machines to the shipping area of the Dixie Cup factory in Easton. Pa. Not only does the clear-plastic pipe carry the containers overhead and out of the way of other operations, but it leaves them unmarked by their whirlwind glide.

NINETY POUNDS OF POWDER, stashed in two cans, with float lines attached, is ready to be dumped from chute on shot boat. Charges are exploded every 500 feet.

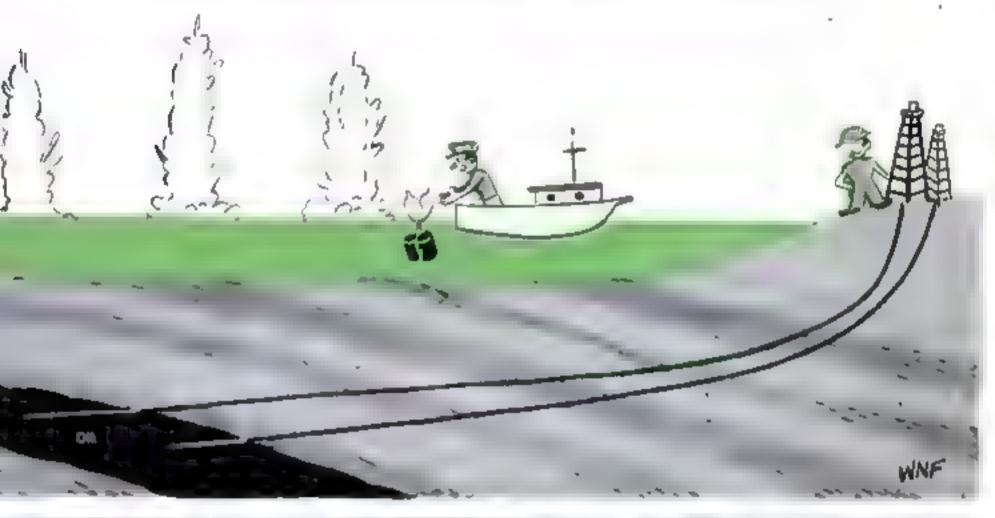

### Depth Charges Spot Undersea Oil

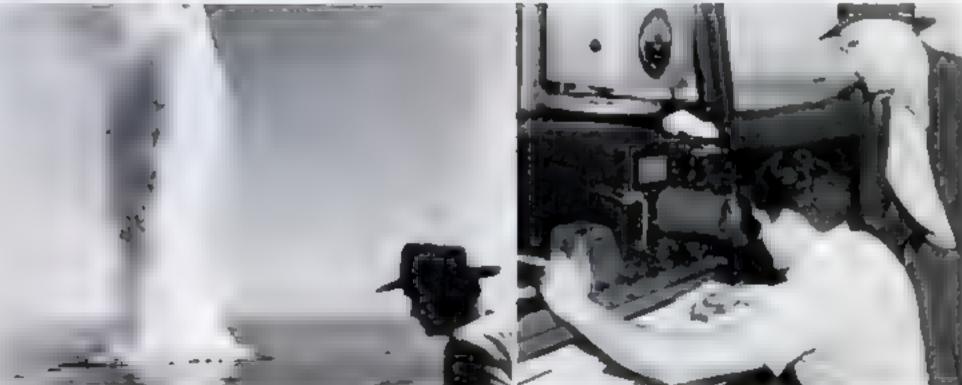

SMALL fleets are pounding away at the coasts of California, Texas and Louisiana, rocking the continental shelf that runs far out to sea with a systematic barrage of depth charges, Scientists and oil operators are the bombardiers. In their search for new petroleum reserves, they are recording the shock waves set up as the explosions penetrate three miles of ocean floor.

Geophones, attached to cables which straddle the underwater blasts, transmit the

impulses in the form of wriggly lines to ribbon-like seismograms. From these charts, trained crews get a clear picture of tideland earth strata, and know at exactly what depth oil may be found.

When a likely driling site is located, it is plotted with a newly developed radio-myigation device called "Lorae" (short for Long Range Accuracy). Lorae uses land-based transmitting stations to pinpoint sites within 15 feet at 50 miles.

WATER SPOUT is only a fraction as high as downward thrust of explosion. Fish-and-game boat accompanies seismic fleet to prevent destruction of large schools of fish.

RECORDING BOAT does triple duty. Beside towing geophones, it carries seismograph which traces intensity of shock waves, and takes bearings of future drilling sites.

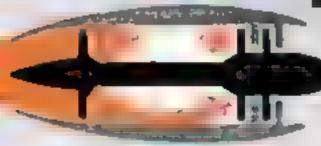

New Airliner

PISTON ENGINE AND PROP

Three Ways to Propel a Plane

PURE PURBOJET

TUEBINE-PROF COMBINATION

#### By Devon Francis

THERE was something funny about the plane as it taxied toward the downwind lip of the runway. It looked like any other twin-engine airliner, But it sounded different. It was too quiet.

Instead of a series of staccato explosions from the engines, there was only a hum.

The pilot wheeled into the wind, released his brakes and the plane gathered speed. But the tone of the hum didn't

Gas turbines promise higher airline speeds
as well as quieter, vibrationless flying.

change. It didn't grow. Some propeller noise merely was superimposed on it.

Then, of a sudden, the plane was auborne. It happened so fast that a spectator had to look twice to believe it.

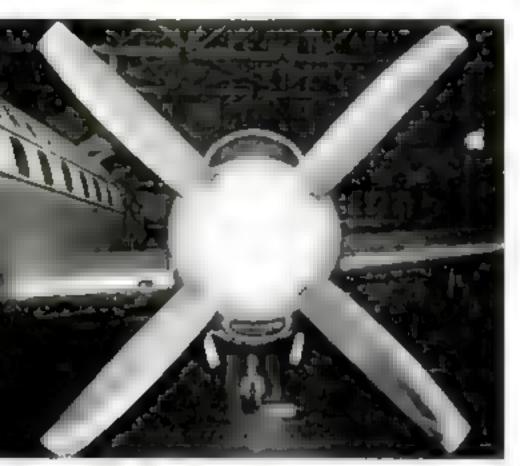

This airliner was unique—it was, and remains, the only one of its kind in the U. S. It introduces a brand-new kind of flying. It's faster. It's smoother and quieter. It's known as a turboprop.

Turboprops are gas-turbine engines the same kind of engines used in jet aucraft—hooked up to propellers. Until recently the gas turbine has been used only in military jets and in British-made jet transports. In those planes the turbines create a monstrous volume of hot gases. They stream out the tailpipes and propel the airplanes by reaction. Now turbines are being used to propel aircraft in another way. They turn propellers, as the more familiar piston engines do.

As the turboprop airplane came unstuck from the runway of Indianapolis' Weir Cook airport, the nose came up. It climbed faster than piston airliners

TURBOPROP ENGINE occupies only a third of nacelle built originally for piston engine in experimental plane. Turbines are started by tiny, built-in auxiliary turbines.

RATCHETS automatically disconnect big props from engines in case of engine failure. One engineer describes idea as having been borrowed "in toto from an old Maying washer."

JET EXHAUSTS boost speed. But turbines turning props take so much energy from gases that gas velocity at exit is only 600 feet a second compared with 1,700 in pure jet.

are capable of climbing—at a rate of a half-mile a minute. Presently it leveled off in cruising flight.

The noise level was low for passengers, crew and people on the ground. Around the Indianapolis airport the Turbo-Liner, as it's called, is dubbed "the flying sewing machine."

But even more evident than the low decibels was the low level of vibration as compared with that in piston-engine airplanes. It was like cruising at 60 in a car on a mirror-smooth highway.

As the Turbo-Liner completed its "climb-out," it drew up alongside an American Airlines transport Chicago-bound. The other plane was a duplicate of the Turbo-Liner—except for power. It had two piston engines producing 4,200 horsepower and weighing more than two tons. The Turbo-Liner's engines produced 1,300 horsepower more and weighed less than a ton and a half. The other plane's flight time to Chicago, 170 miles away, was 53 minutes. The Turbo-Liner could make it in 37.

#### Turbo-Liner Pulls Away

Pacing the other plane, a Convair 240, the Turbo-Liner was registering 220 miles an hour. Then it pulled away. In 40 seconds it had reached an indicated speed of 290 miles an hour. Corrected for altitude and outside air temperature, the actual speed was more than 300 miles an hour.

A few minutes later the plane coasted in toward the runway. The wheels touched. Suddenly the big machine slowed to a walk.

The engines hadn't changed tone. The props hadn't been reversed. The brakes hadn't been applied. The plane stopped like a quarter-inch electric drill when a fuse blows.

This new turboprop airliner, the property of the Allison Division of General Motors, is still experimental. Powered with two Allison gas-turbine engines, it can still be vaguely identified with jet airplanes.

Of the 2,750 horsepower that each of the two turbines develops, 10 percent comes from jet propulsion. The rest is pure shaft horsepower produced by power plants whirling at 14.300 revolutions a minute. Airplane piston engines turn over at about 2.000 r.p.m. Extension shafts run from the Turbo-Liner's engines to gearboxes where the props are geared down to approximately the same speed as those of piston engines.

Unlike piston engines, the Turbo-Liner's turn at practically the same speed all the time—idling and in full flight. The only factors that change much are the rate of fuel flow and the pitch of the propellers. The blades go all the way from reverse through neutral

to full cruising pitch

The Turbo-Liner is simpler to fly than a piston-engine airplane. The pilot has a single lever control for each engine that replaces five separate controls in a conventional airplane—the throttle, prop pitch, fuel mixture, supercharger and carburetor heat. For take-off, landing, taxing and parking, he can go from reverse to take-off power merely by moving the lever back and forth.

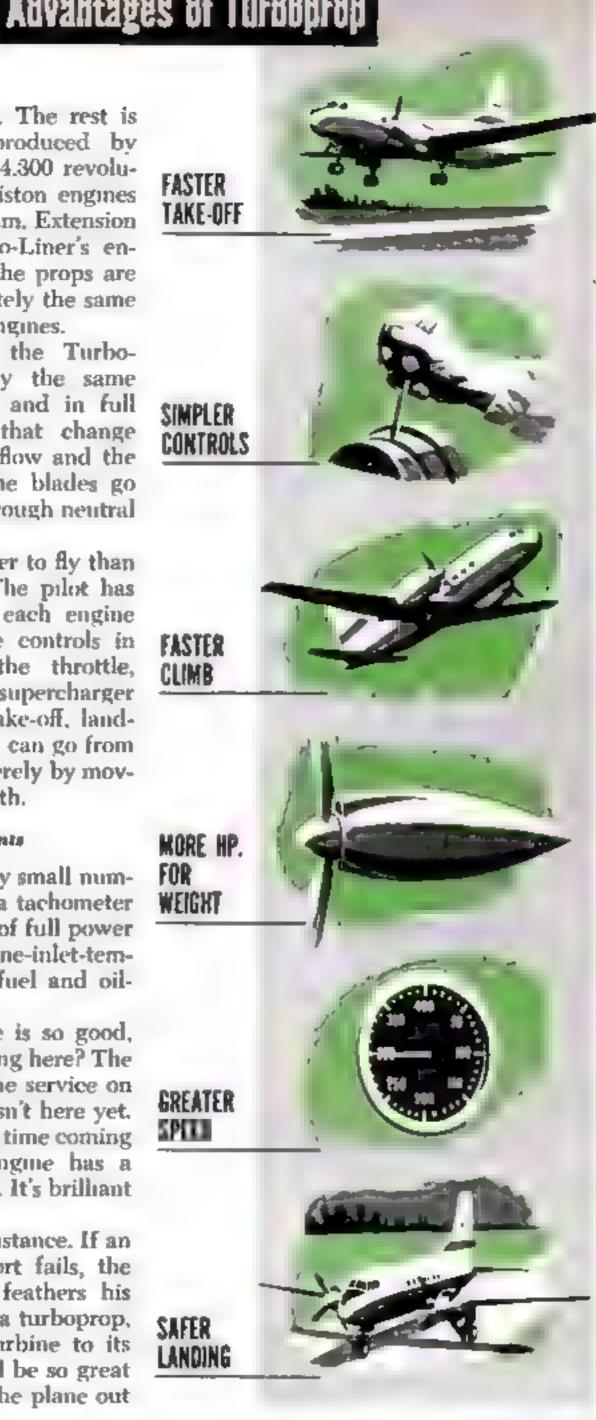

#### Uses Few Instruments

He can fly on an unusually small number of engine instruments—a tachometer (marked off in percentages of full power instead of r.p.m.), a turbine-inlet-temperature gauge and some fuel and oil-pressure gauges.

If the turboprop airplane is so good, why did it take so long getting here? The fact is that for regular airline service on this side of the Atlantic it isn't here yet.

The turboprop was a long time coming because the gas-turbine engine has a Jekyll-and-Hyde personality. It's brilliant but ornery.

Take engine failure, for instance. If an engine on a piston transport fails, the pilot cuts his switch and feathers his prop, and that's that. With a turboprop, the resistance of a dead turbine to its windmilling propeller would be so great that the drag could throw the plane out

PILOT VERNON A. FORD moves only two levers controlling engines and props. In place of manifold-pressure gauge to show power, he watches turbine-inlet temperatures.

KING-\$12E cargo door is six by eight feet. In the opinion of one aeronautical engineer, turboprop's greater efficiency will lead to lower airline tariffs.

TURBO-LINER "breaks ground" quickly, climbs more than twice as fast as comparable pistonengine plane. Turboprops can bring faster airliners into airports too small for jets.

of control before the prop could be feathered.

So the engineers literally broke in two the shaft connecting engine with gearbox and prop. The shaft is splined at the break and spring-loaded so that the two parts become one under normal operating conditions. If an engine quits in mid-air, its inertia, tussling against the effort of the air stream to turn the propeller, overcomes the spring tension and separates the two parts of the shaft.

#### Range of Engine Speed Is Slim

The simplicity of control is only a by-product of the effort to harness an engine that likes its own head. The range of engine speed—from 12,500 to 14.300 revolutions a minute—had to be kept slim because of a peculiarity of the gas turbine. It isn't "self-sustaining"—it won't keep going on its own—under 5,000 r.p.m. Moreover, when the fuel flow is reduced, a turbine falls off rapidly, as much as 2,000 revolutions a second. In flight, the r.p.m. is constant at 14,300.

So keeping up the speed is essential. That led to the single lever. A pilot can't kill an engine with his throttle because the lever won't bring its r.p.m. below 12.500. Only a special fuel-cutoff valve will shut it off.

Engine speed is only incidental to power output. As more fuel is poured into the engine, the tendency of the engine to speed up is offset automatically by a higher pitch, producing more thrust and maintaining constant speed.

The willingness of a turbme to quit working as soon as the fuel flow is cut down is turned to advantage in landing. The wheels touch, the pilot retards his control levers, and the propellers come back to flat pitch. But the air stream still tries to turn them. The turbines object, high drag sets in, and the plane slows to a crawl on the runway in almost less time than it takes to tell it.

The almost-constant engine speed is a guarantee of full power if a pilot misjudges a landing and has to try again.

## There's a Surprise Under This Hood

Turn the Page to See the Engine

#### Even a traffic cop would have to unbend to give the low-down to the driver of this latest of the British little-car arrivals.

If YOU like your motoring in a small package, a Sharp's Bear Cub-one of Britain's latest car exports to this country—gives it to you with comfort, economy and that Continental look

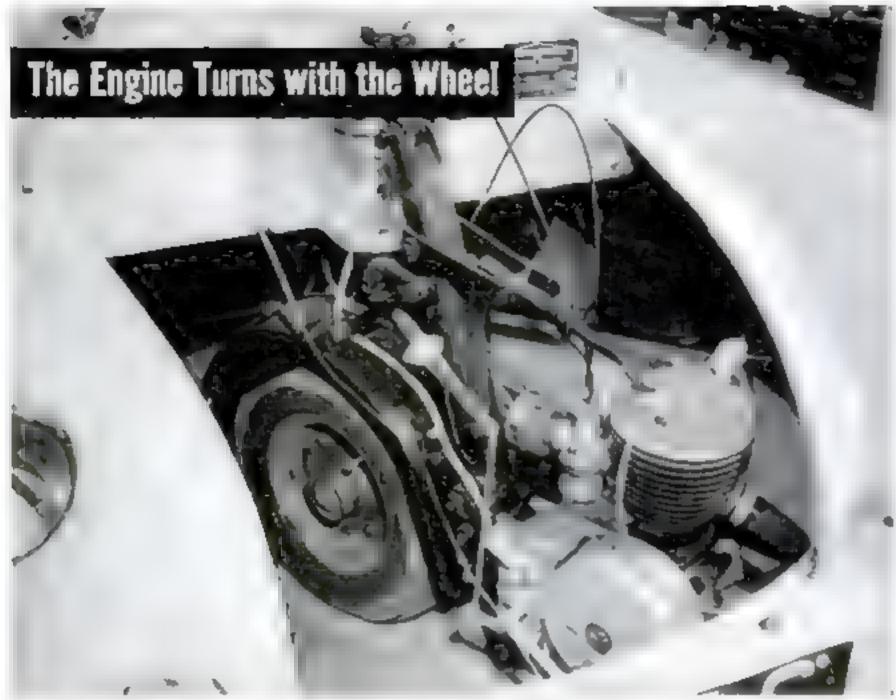

It's a three-wheeler, but the big bonnet (hood to you) and the fancy front fenders stack up with the substantial appearance of its little four-wheeled brothers. Seating two, there's plenty of leg-stretch room under the hood for both driver and passenger to ride comfortably.

And this Bear Cub is no chowhound-it

cruises at 40 miles an hour on a diet of 77 miles to a gallon. Top speed is 50.

A 420-pound bantamweight, the midget car is 116 inches long, 57 inches wide and 45 inches high. Its aircraft-riveted, stressed-skin aluminum-alloy body combines light weight with rigidity. Other features include three-wheel brakes, a one-piece, curved safety-glass windshield, electric windshield wiper, individually controlled twin spothights, and even turn lights that pop out of the front fenders.

Top and side curtains, the latter carried

UNDER THE HOOD, mounted on the front-wheel unit, is this eight-horsepower, two-cycle Vil-

liers air-cooled motorcycle engine. Transmission is by endless sprocket chain.

in the luggage compartment, are made of a woven-plastic fabric that is said to be shrinkproof. The one-cylinder motorcycle engine is manually started from the driver's scat by a pull lever, assisted by an automatic decompressor. There are three speeds forward. Reverse and a self-starter are supplied as extras.

The U. S. distributors of the Bear Cub, Craven & Hedrick, Inc., 522 Fifth Ave., New York City, quote the price, delivered in New York, at \$895.—Herbert O. Johansen

FRONT WHEEL and engine can be turned by the driver a full 90 degrees in either direction. This enables the Bear Cub to be turned in its own length, pivoting on its rear wheels.

LUGGAGE COMPARTMENT behind seat has about 20 cubic feet of space. In it are carried, as standard equipment, side curtains, spare wheel and tire, and a small tool kit.

conventional motion picture LENS records what it sees without distortion, but its three-units-high by four-units-wide proportions limit the field of vision,

DUPLICATING HUMAN VISION, Cinemascope's anamorphic lens takes in an area one unit high by three units wide, then compacts it on standard-width film.

## "Squeezed" Movies Challenge 3-Ds

Trick lens condenses huge Hollywood sets, then stretches the picture out again—across gigantic 80-foot screen.

#### By Andrew R. Boone

IN A multimillion-dollar bid to woo you and the missis back to the Lyceum, Twentieth Century-Fox is blowing the dust off a 16-year-old camera lens that turns out the world's zamest pictures. Point this oddly shaped glass assembly at Burl Ives strumming a guitar

in the shade of an old oak tree, and he comes out looking like Frank Sinatra tooting an oboe under a grapevine.

And that's only half of it. To its right and left this anamorphic lens has scanned twice as much scenery as a conventional camera lens, and squeezed it all on a single, standard-width film.

Run this through a projector equipped

STEREOPHONIC SOUND calls for three dollymounted microphones, whose shadows must be flooded out with special lighting. Twentieth Century-Fox is testing the comparative

quality of multiple sound tracks on the picture film, and independent sound tracks which would be synchronized in theater projection booths.

with another anamorphic lens and presto—Burl Ives expands to his proper proportions, flanked by a breath-taking setting half a city block wide!

Not since Al Jolson opened his mouth to fill American flicker houses with synchronized sound, has science offered the movie industry anything so charged with entertainment possibilities as this amazing peripheral-vision lens developed in 1937 by a modest French scientist named Henri Chrétien.

In a neat housing hardly larger than a king-size pack of eigarettes, the anamorphic lens produces a wide-screen picture comparable in size to the image achieved by Cinerama. But unlike Cinerama, Cinemascope (Twentieth Century-Fox's trade name for anamorphic productions) has no disturbing, film-lapping edges, no change of color values.

#### Different from Wide-Screen Classics

Don't confuse Cinemascope with socalled wide-screen classics now going the rounds of the larger metropolitan theaters. Unlike Cinemascope, they are narrowed-down, conventional films. Quickchange artists have simply placed a shallow mask behind the film track of a standard projector, then spread the image with a wide-angle lens.

Apart from scalping the actors and chopping their legs off at the thighs, it also magnifies the film grain to the atomsmashing point, giving fair-faced starlets more freckles than Arthur Godfrey.

Cinemascope, too, must be magnified. But because the height of the image has not been reduced by the anamorphic lens, the grain appears on the screen in the form of barely noticeable microscopic horizontal threads.

But the real impact of Cinemascope will come from brand-new technical tricks and radical changes in film directing. If you have seen Cinerama you know how wide-screen productions can engulf you in a Technicolor are charged with breath-taking action, beauty and stereophonic sound. That two-bour assortment of shorts used every ocular and audio gimmick of the trade to chill and thrill you.

Cinemascope must do more. To take a permanent place in the entertainment world, it must make you forget that it

## Trick Engine

Midget auxiliary pistons vary

#### By Gene Lindberg

A MAN named I. B. Humphreys returned from a business trip of several hundred miles in his six-cylinder 1949 Oldsmobile the other day with a record of 24 miles to the gallon of gasoline at a highway cruising speed of 60 miles an hour.

Even at that, his gas mileage was low. He gets 30 miles to the gallon at 40 miles an hour; 36 miles to the gallon at 20 miles an hour. That is half again as much as an ordinary 1949 Olds will deliver. And he buys his fuel at any filling station.

Humphreys' car is no ordinary Olds. It's fitted with what he calls a con-

miles an hour with this special head permitting controlled compression on standard Olds.

# Head Ups Gas Mileage 50%

the compression ratio automatically to suit the load and speed.

trolled-compression engine. Unlike other gasoline engines, its compression ratio—that is, the amount that its air/gas charge is squeezed on the compression stroke—varies all the way from 632-to-1 to 14-to-1.

The engine basically is a standard Olds "76" L-head. Humphreys, inventor of a means of getting a wide range of compression ratios, modified it.

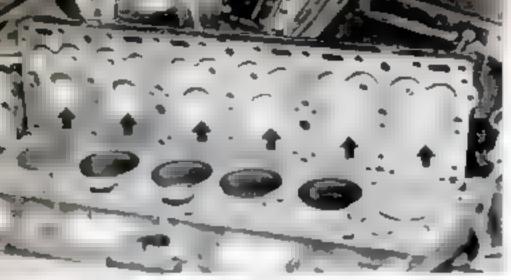

The engine changes compression automatically by varying the size of its combustion chambers. At light load and part throttle, the compression ratio shoots up. When the engine works hard and the throttle starts opening, the ratio drops. The ratio can bob up and down like the float on a fishing line because

of a little auxiliary piston in the head of each cylinder. When the piston goes up, it increases the volume of the combustion chamber. When it goes down, it decreases it. It's that simple.

#### No Other Car Like It

Humphreys has the only automobile in the world that operates like this. When he rolled into his garage and switched off his ignition the other day, he completed almost three years and 50,000 miles of controlled-compression driving.

His engine is one answer to a fundamental fault of all internal-combustion engines. Ever since World War II ended, the automobile manufacturers have been

ENGINE HEAD opened shows positions of spring-control pistons (arrows) built on principle of hydraulic valve lifters. Oil pressure on them varies from 25 to 50 pounds.

boosting compression ratios to get better gas mileage. The higher the compression ratio, the better the fuel burns, the greater the amount of power delivered.

But the basic trouble remains. While the compression ratio remains the same, the density of the charge in the cylinders swings wildly from low to high and back again as pressure on the accelerator pedal changes. What is needed is an equal amount of squeeze—an equal amount of pressure per square inch—throughout the speed range.

But the amount of squeeze on the compression stroke is limited. When a car engine is working hard at low r.p.m. when it's climbing a hill at low speed, for instance—it wants to "ping." The pressures in the cylinder heads build up. The fuel tends to explode instead of burning progressively. That wastes gas.

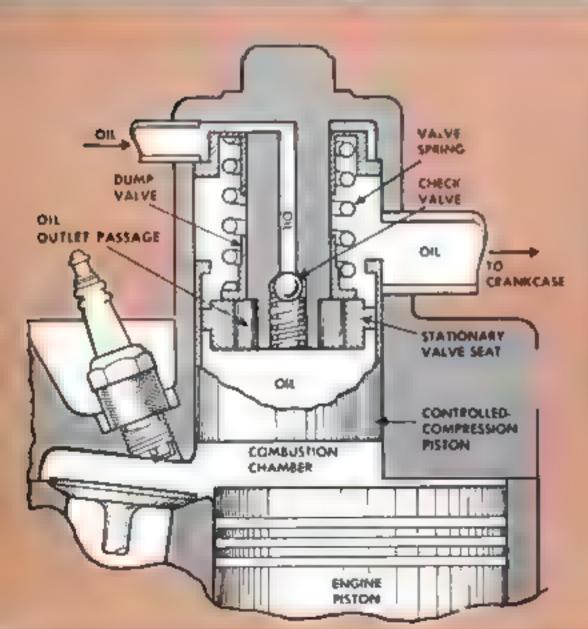

It's the necessity for preventing ping under heavy load and low r.p.m. that limits the compression ratio in fixed-compression engines. Yet any of today's engines could cruise happily, without pinging, at a ratio of 12-to-1 on ordinary gas under light load at high speed.

Fixed compressions result in poor gas mileage at light throttle. Denied the chance to put the squeeze on an air/gas charge that is only a fraction as dense as at full throttle, the engine extracts only a pittance of the power in the fuel.

Ever since the turn of the century engineers have resorted to sundry ways to make internal-combustion engines more responsive to load and throttle conditions without knocking. The Kettering high-compression engine (PSM, Oct. '51, p. 125), using fuel beyond 100-octane rating, is one of them.

Humphreys' modification doctors the ailments of the internal-combustion engine by tailoring the compression ratio to engine load and throttle setting. As the load drops and the speed goes up, the engine becomes progressively more capable of tolerating higher compressions.

W. H. Paul, professor of automotive

PRINCIPLE of controlled-compression engine is simple. Oil under engine pressure pushes down on little auxilsary piston in effort to reduce size of combustion chamber and raise compression. Combustion pressures try to push little piston up, decreasing compression. In actual practice, oil, retuined by check valve, presses both on > ston and a spring-loaded dump valve. . hen throttle is opened, combustion pressure rises, oil presses on and opens dump valve, oil is released, and piston goes up. When throttle is eased off, combustion pressure drops, dump valve closes and oil pressure again is built up on piston and valve to boost compression ratio.

Humphreys (for right) pauses with friends on Pikes Peak trip in controlled-compression car.

engineering at Oregon State College, has worked with Humphreys on the road tests. They report that the engine has been practically trouble-free throughout, and described it in a joint paper read before the Society of Automotive Engineers in 1951.

#### Critica Are Anneered

The engine did not get off scot-free of criticism. Engineers from GM, Ford, the Shell Oil Co. and the Ethyl Corp., asked by Humphreys and Paul to comment, contended that the engine could not get as much gain in gas mileage from variable compression as they could get from raising fixed-compression ratios.

Humphreys, a businessman with extensive oil and mining interests, and Paul told their critics that their principle "is not a substitute for any feature of high fixed-compression ratio." But they remarked that fuels for engines with compressions of 12-to-1—like the GM experimental engine—would be years in coming.

In the two years intervening, Humphreys has made improvements on his engine. At full throttle he is getting 15 to 20 percent more horsepower than the standard 1949 Olds Six delivers on premium Ethyl gasoline.

Humphreys says his principle can be adapted with no great effort to any engine. "An automobile manufacturer," he states, "could convert his L-head engine production over to this design at less expense than it would cost him to convert to valve-in-head design."

The application to existing valve-inhead engines he terms "relatively simple." END

#### Whirlibird Beats Its Wings Coaxially

With twin blades whirling at top speed, this new copter bores through space at 100 miles an hour. A 450-hp, aircooled radial engine drives the coaxal rotor. Built by Gyrodyne for the Navy, the copter bank a pilot, medical corpsman and three litter patients-or a pilot and six passengers, and fuel for three and a half hours of flight

#### Airport Tug

COPTER tugs that would grapple airplanes to lift them into the air or to set them down within restricted areas have been proposed by Dr. J. A. J. Bennett of Hiller Helicopters,

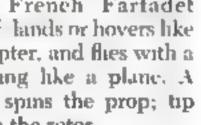

#### Jet Windjammer

THREE jets-one at the tip of each blade-spin the French Ariel III on its way. Because the rotor is selfpropelled, it develops no torque and no compensating windmill is needed at the tail to keep it from slewing around

#### **Aerial Convertible**

THE French Farfadet takes off-lands or hovers like a helicopter, and flies with a fixed wing like a plane. A turbine spins the prop; tip jets turn the rotor.

#### Twin-Spin Amphibian

Tills Navy copter has two intermeshing rotors-like an egg beater-with control flaps on the blades. The Kaman HOK-1, it's a four-place job with air-cooled engine.

#### **High-Tailing Copter**

THIS Doman is first production copter with a single four-bladed rotor. A second rotor rides a high-angled tail that keep blades above head level on the ground.

## Here's a Tricycle Built for Seven

LOS ANCELEANS think their ears are playing tricks these days. They hear the put-put of a motorcycle but what their eyes see riding by is a full-size station wagon with seven passengers aboard. It's one of a trio of three-wheelers built by Hans Vidal and Sons of Hamburg, Germany, and imported by Fred J. Tabery, L.A. businessman,

Vidal developed the cars while experimenting with motorcycles. A two-cylinder, two-cycle engine drives each version through the front wheel. A chain carries the power. The engine, radiator and wheel turn as a unit when the steering wheel is flipped.

Frankly intended for the economy-minded, the Hansents are touted to int a top speed of 50 miles an hour on a 25·1 gas-oil fuel mixture. At lower speeds they can cover 35 miles to the gallon. Each model would sell for under \$2,000 m the U S. and a replacement engine would cost a measly \$85.

MAISED HOOD SHOWS tiny water-cooled engine mounted on fork so it turns with the wheel. Wheel is sprung by independent twin-coil suspension combined with telescopic shocks,

PANEL TRUCK weighs in at 1,640 pounds. Like the other versions, it rides cary with dual-coil springs over each axle. Chassis is of distortion-free, central-tube design.

PICKUP TRUCK, lightest of trio, weighs only 1,440 pounds but can haul 1,500-pound pay load. Takery says cars take curves and handle in traffic with stability of four-wheelers.

# Explorers' New Finds Tell of Monster

SIXTEEN INCHES LONG, this Great Cave Bear skull from an English cavern shows the size of the prehistoric monster's head.

Dramatic story of how Stone Age men battled great beast is pieced together from clues in caverns.

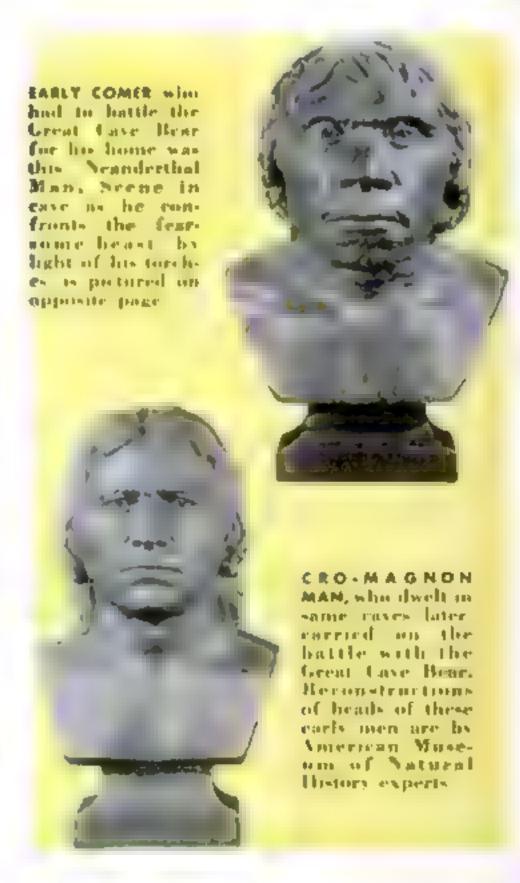

#### By Alden P. Armagnac

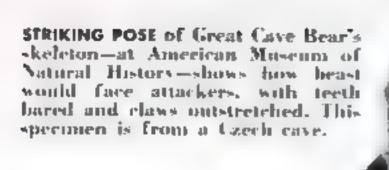

BLASTING their way through centuries-old walls of living rock, delvers into the past are enriching our knowledge of a creature that has inspired tales of dragons. Their discoveries tell of life-and-death battles, by torchlight, between cave people and a gigantic beast of the Stone Age—the Great Cave Bear.

Newly opened caverns have lately yielded fresh trophies to be added to the growing lore of this nightmarish animal. Its skulls, bones and petrified footprints were found in the "Witch's Cave" near the Italian village of Toirano, when fossil hunters dynamited a six-foot-thick stalagmite that had barred the way to an unexplored gallery since the cave's discovery in 1880. Again its remains came to light, last year, in a previously unknown cave uncovered by blasting near Santander, Spain.

Beside the Great Cave Bear, today's ferocious grizzly bears would look like

112 POPULAR SCIENCE

Cave Bear

CAVE MEN, whose life centered near mouth of a cavern, sallied forth on hunts—and, as shove, to repel animal invaders, likewise seeking refuge from bitter cold of that era.

dwarfs. Its most striking feature was its enormous head, as shown by the great size of the skull. Its forepaws likewise were enormous, and its body thickset and massive.

Although this prehistoric monster has seldom been mentioned in popular literature, discoveries of its bones have given rise to numerous descriptions of it in naturalists' writings.

What may be the first dates back to 1672. In that year J. Paterson Hayne studied some of the bones from a cave in Hungary, and solemnly published his conclusion that they were the bones of dragons. For half a century, that was accepted as fact.

The most recent study of the Great Cave Bear occupies more than 50 pages of a new two-volume work, A Review of Fossil and Recent Bears of the Old

World, published this year by a Dutch naturalist, D. P. Erdbrink, A map he has compiled, from all the places where Great Cave Bear remains have been found, shows that the monster ranged over a large area of continental Europe and part of Great Britain, then joined to the continent by a land "bridge."

Seven feet from nose to stubby tail is the estimate given by Erdbrink for the size of one Great Cave Bear whose skeleton he measured.

Some naturalists have called this animal the biggest bear that ever lived, and a leading encyclopedia says so flatly. Other authorities dispute it. In one small part of the world, it turns out, there may be even bigger ones today—the Peninsular and Kodiak brown bears of Alaska, now known to reach a maximum length exceeding nine feet and a weight of more than 1,600 pounds. But all agree that, at the very least, the Great Cave Bear was a near rival in size to these.

#### Men Battled Monster Bears

Weapons and tools of cave people, found intermingled with the remains of the Great Cave Bear, show that they lived at the same time and in the same caves! That the men must have battled the beasts has been shown by circumstantial evidence aplenty. Then a one-chance-in-a-million find, such as scientists hope for only in their dreams, clinched it beyond all doubt. A cave near Trieste yielded a Great Cave Bear's fractured skull with a cave man's stone axe still embedded in it.

Here is an example of fact that rivals fiction. When cartoonists take liberties with facts by picturing cave men and dinosaurs in the same scene—actually, dinosaurs were extinct when men appeared on earth—they're overlooking exciting battles between men and monsters that really happened.

It was a time of far different climate from today's, this strange and longdrawn-out period in the dawn of mankind. Alternately Europe shivered and thawed, as four successive ice sheets buried its northern part and then retreated. Besides the bears, its fauna at times included reindeer, elephants. rhinoceroses and mammoths.

Great Cave Bears, having roamed outdoors in milder months, retired to caves at winter's approach and hibernated in

their comparative warmth.

Likewise seeking refuge from the bitter cold, Stone Age people set up housekeeping in the same inviting caves. Among the early comers was the extinct and "lowbrow" race we call Neanderthal Man, who hved during the period from 100,000 to about 20,000 years ago.

Picture a Neanderthal family as night falls, huddled about their fireplace within the cave's mouth for warmth, with the fitful flames casting grotesque shadows over the moisture-dripping limestone walls. The fire dies to embers, the gloom deepens. And then they see, peering at them out of the blackness, the glowing eyes of the great beasts!

Men or animals had to go—and, standing their ground, the cave people girded for a war to the finish. Soot-filmed walls of some of these caves reveal their principal tactic. They smoked out the monster bears. As proof of the soot layers' date, they bear the imprint of actual claw marks of the bears, perhaps made as the animals tried to escape. For as the bears lumbered from their hiding places—probably groggy from the fumes, but still formidable—the cave men set upon them with flint spears and axes.

#### Death-on-the-Left Mystery Solved

Sometimes a cave's natural layout lent itself to stratagem. A puzzle at first, to explorers of the Dragon's Cave near Mixintz, Austria, was discovery of a great many cave-bear skulls that had all been fractured on the left side! Then they found a place in the cave, marked by two Neanderthal fireplaces, that was ideal for an ambush. A cave man concealed there could club an animal coming out of a narrow passage from the cave's innermost part. The blow would strike an emerging beast from its left side—and the riddle was solved.

Whatever the casualties among the Neanderthal bear-fighters, they won. As experts sift successively later cave deposits, cave-bear bones continue to be found, but Neanderthal tools and weapons show the cave men securely in possession.

And then Stone Age events take a

Picturing animals on cave walls was probably a Stone Age rite to assure good hunting.

AUGUST 1953 [[5]

strange turn. Neanderthal Man vanishes without a trace!

The curtain has fallen upon his prehistoric drama. When it rises again, upon another, a superior new kind of cave man has inherited the warfare with the Great Cave Bears.

The newcomer upon the scene is our own ancestor, Homo sapiens. He first appears about 20,000 or 25,000 years ago. Intelligent, handsome, amazingly modern-looking is his outstanding representative, known as Cro-Magnon Man.

Did he exterminate Neanderthal Man—or drive him off to some unknown exile? What happened remains veiled in mystery. All we know is this: Cro-Magnon Man took over the abodes of his predecessor so suddenly that deposits in 18 European caves show no discerni-

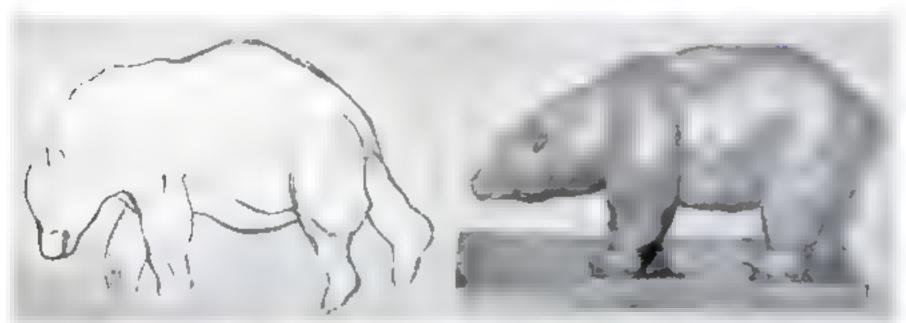

ble lapse of time between occupancies.

Now the odds against the Great Cave Bear became more one-sided. Cro-Magnon hunters had advanced weapons for their times, possibly even including the bow and arrow, and could cope with it more effectively. But it is clear that they did not immediately hunt it to extinction, for the bones of the Great Cave Bear continue to be found for a considerable period; perhaps other factors such as changing climate had more to do with its ultimate end.

#### Last Men to See Bear Alive

Last of Stone Age men to see the Great Cave Bear alive, these primitive but talented people preserved for us their impressions of what it looked like. Along

THE WINNER BY TWO MILES, Paul Goldsmith streaks across the finish line at Daytona

Beach last March. He won A.M.A. 200-mile classic in fastest average time on record.

# He's the "Golden Boy" of Motorcycle Racing

New speed champion of the two-wheelers tells how he sets records and piles up prize money.

#### By Martin L. Lovelander

IN A blazing race on the pavement-like sand of Daytona Beach last March, Paul Goldsmith, a lean, blue-eyed six-footer from St. Clair Shores, Mich., won motorcycling's top speed contest in the fastest time ever recorded. Goldsmith, a quiet, extremely modest 28-year-old, traveled 200 miles around the 4.2-mile championship course at an average speed of 94.45 miles an hour.

"On the straightaways," he says, "they

tell me I was doing 133."

First home out of a field that at the start had included 111 of the best riders among the American Motorcycle Association's 100,000 members, he won himself a tall, golden trophy and \$2,500 in cash. By fall, at the rate he has been copping prize money in other bigtime motorcycle races all over the country and practically every weekend, Goldsmith will have added two or three

times that amount to his total pot for the season.

Married 10 years and part owner of a service station in Royal Oak, Mich., Goldsmith has none of the flamboyance you might expect of a champion jockey of the two-wheelers. He loves to tinker with and tune an engine till it whispers, and he revels in the roaring excitement of a race, but there's not an ounce of bluster or vanity in his make-up.

"Paul's as crafty as a scientific boxer," says an old friend who has doggedly competed with him many times, "If you happen to get out in front, you always know he's close to you, just waiting for you to make a mistake in judgment. And when you do—bingo, brother, there goes

your win!"

Even the first time Goldsmith ever rode a motorcycle in a race, he took third place. That was in 1946 at Partington Pastures, outside Detroit—a flat dirt race track on which the competing

THE "GOLDEN BOY" IS OUT IN FRONT, streaking far ahead of the field on a typical dirt track,

with unbanked turns. The race has just begun, for the "groove" has not yet been worn.

"BROAD SLIDING" AROUND A TURN consists of braking and balancing by dragging steel-

LOOKING FOR ILLEGALITIES, such as nonstand and parts, aftered bore and stroke, compression ratio above 8 1, VM V, Lechnical Committee thecks over Goldsonth's lake

"There's a good reason for that," Goldsmith remarked soberly. "All the guys ride so close together that if anybody applied brakes, the whole crowd would probably pile up in a heap."

Lack of brakes didn't fluster him, nor did the fact that he was on a spare bike of a kind that he had never ridden before. He had come to watch, but somebody invited him to ride, so he rode. And nearly won.

That did it. Nearly every weekend of the spring, summer and fall of most of the seven years since then, Goldsmith has competed in county fairs, charity

slippered left foot. Looks like an awkward position of rest but was done at 65 m.p.h.

meets, club contests and A.M.A. championship races. There are 14 of the latter each year. They vary in distance from five to 200 miles, on tracks from half a mile to 42 miles long. They are usually scheduled for weekends or holidays, in widely scattered parts of the country. This year they are being run in Ohio, California, New Hampshire, Kansas, South Dakota, Wisconsin, Pennsylvania, Michigan, Louisiana and, naturally, Florida.

#### Covers the Country

Goldsmith, present national champion in the 15-mile A.M.A. race as well as the 200-mile, earns from \$5,000 to \$8,000 in prize money a season. The season, with the exception of the big event at Daytona Beach, extends from April to late October. He has flown to California contests, but usually he and his mechanic and another friend or two ride to the meets in an automobile, his motorcycle jouncing along behind on a small trailer.

This sometimes means driving as much as 1,700 miles in a weekend. But Goldsmith doesn't mind this, as long as he gets a good night's sleep before a race. And neither does his small, brunette wife, Helen, who generally goes along to watch and worry, as any loving wife might well do.

Coldsmith rarely worries about a race very far in advance, but on the day it is scheduled to be run, he declares he gets mighty nervous. Not enough so to cause him to lose his appetite for breakfast, as many of his competitors do,

but still plenty uneasy.

He has one wise formula for calming himself down and at the same time shrewdly improving his chances of winning. For about 20 minutes or half an hour before a race starts, he walks around the course, carefully studying the condition of the track, pacing off the straightaways, looking for tacky spots on the turns, and estimating where the "groove" will form. The groove is not a narrow rut, as you might think, but the smooth, fairly broad path that many furiously spinning wheels quickly clear in the loose dirt of the track.

This hard, clean-swept surface rapidly becomes sticky with torn-off tread and provides splendid traction. Every racer tries to stay in the groove as much as possible, for there is grave danger of spills and certain loss of speed in the crumbly soil on either side of it. But sometimes a lingering dampness from a recent rainstorm will have left a streak just to the inside of the groove in a tacky condition. Goldsmith keeps a sharp lookout for those spots and tucks the knowledge of their location away in his mind.

#### Races Won by Inches

By veering a few inches away from the groove at such a place, he has learned that he can gain just enough extra traction to forge ahead of his nearest contender and perhaps even ahead of the field. After all, many motorcycle races are won by a matter of a few inches headway.

Before each race in which he is entered, Goldsmith has additional time to study and make allowances for the changing condition of the track as the preliminary novice and amateur heats

are run off.

This clinical knowledge of the course he is going to run not only gives him a frequent advantage coming out of turns but enables him to decide what gear ratio will give him the most for his power, considering the state of the track.

On his new, 350-pound Harley-David-

son KRTT, on which he won the Daytona Beach classic, he has a choice of 76 gear ratios, according to the various sizes and combinations of rear-wheel and motor sprockets he puts on. Sometimes he makes a change just before his race starts—not too difficult to do, for the whole job takes an experienced man only five minutes. He can obtain further variation in gear ratio by using tires of different sizes, and alter their traction by the amount he inflates them.

"Once the race begins, I'm too busy to be nervous about how it's going to

end," Goldsmith says.

#### Keeps in Shape

That is easy to understand. There is little urge to ponder the outcome when your fellow riders are so close that their front wheels often gnaw at your leather-shod left leg and wear the paint off the number plate under your seat.

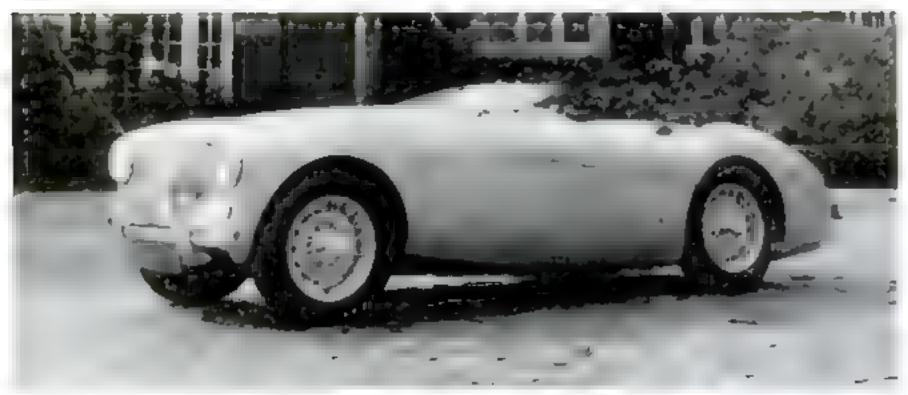

Goldsmith doesn't smoke or drink. He gets a lot of sleep. He passes up desserts, holding his weight to a lithe 145 pounds. He keeps his hands, arms and legs in the steely shape motorcycle rac-

[Continued on page 216]

TO THE GRINNING VICTOR at Daytons went a big hug from his wife, a tall trophy and \$2,-500. Goldsmith rode a four-speed Harley-Davidson with a foot shift and hand clutch.

#### British Sports Car Gives High Horsepower Per Pound

This Austin Healey Hundred was designed for Americans Driven by a 90-horse power engine, its 1,900 pounds zoom by at 110 miles an hour, or leap from curbside to

60 miles an hour in 11 seconds. The wind shield lowers to form a streamlining "scuttle" at high speeds. It will sell for about \$3,000, plus shipping costs from U. S. port of entry.

#### Mink Thrives on Vitamins

This time the mmk is being investigated--by University of Wisconsin's Biochemistry Department, Although it takes thick canvas gloves handle them safely, scrappy minks are delicate and hard to raise, Wisconsin studies show that a diet fortified with milk and raw liver makes for larger and hardier specimens, improves the quality of pelts.

#### Swivel Base for Serving Tray

Suction grips on this maple-finished

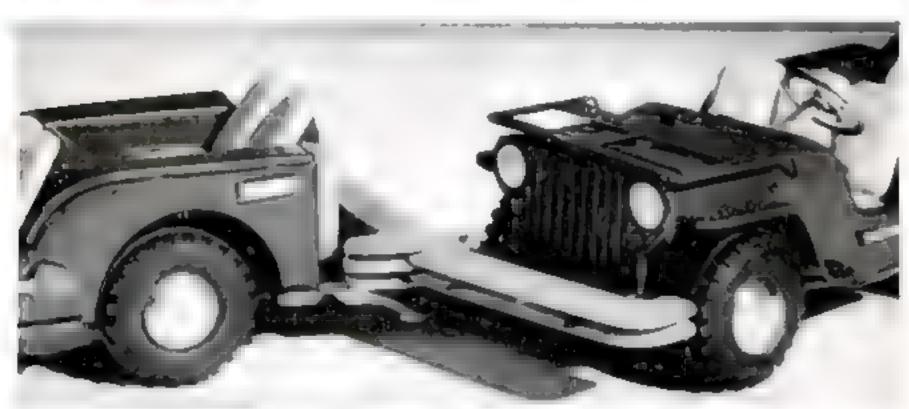

Serv-Mobile hold any tray above it firmly, to make a handy lazy susan. Fourand-one-quartermeh, rotating base costs \$1.49, is sold by Mrs. Dorothy Damar, 999 Damar Bldg., Newark 2, N. J.

#### **Light Horse Keeping**

SHOULDER-SLUNG vacuum cleaner which dusts off dobbin and leaves his cout as shiny as a newly waxed floor, was demonstrated at the recent Technical Fair in Hannover, Cermany, Manufacturer Stemens save it's an indispensable grooming aid for all domestic animals, and offers this A.C.-D.C.motored model for about 200 marks (\$48).

#### Pleated Bumpers Save Pleated Fenders; Can't Interlock

CORRUGATED safety bumpers which can't interlock in a collision, are urged as universal car equipment by their inventor, Charles F. Martinetz. Two or more impact

bars eliminate need for uprights, and deep, fluted construction produces high impact strength. Hole at center gives sturdy support for a towing pin, or trailer coupling.

As the bags touch ground, they open automatically and conservationists waiting on the ground plant the released beavers by hand just where dams are needed

#### Decorating Made Easy—Now the Wallpaper Goes Up Dry

The lady wielding the roller is not painting a room, she's getting set to hang wallpaper by applying a new kind of paste that goes on the wall instead of on the paper. The unhandlest handy man can then unwind the pretrimmed wallpaper and press it into place as shown at far right.

A gailon of the adhesive—enough for an average living room—costs about \$2.50. It's called EZE Hang, and the Commercial Packaging Corp., Hammond, Ind., makes it.

WILBUR SHAW REPORTS FROM THE DRIVER'S SEAT:

# This Monster Behaves Like a Midget

Power steering and twin 350-hp. diesels make mountain-moving light work for 50-ton truck.

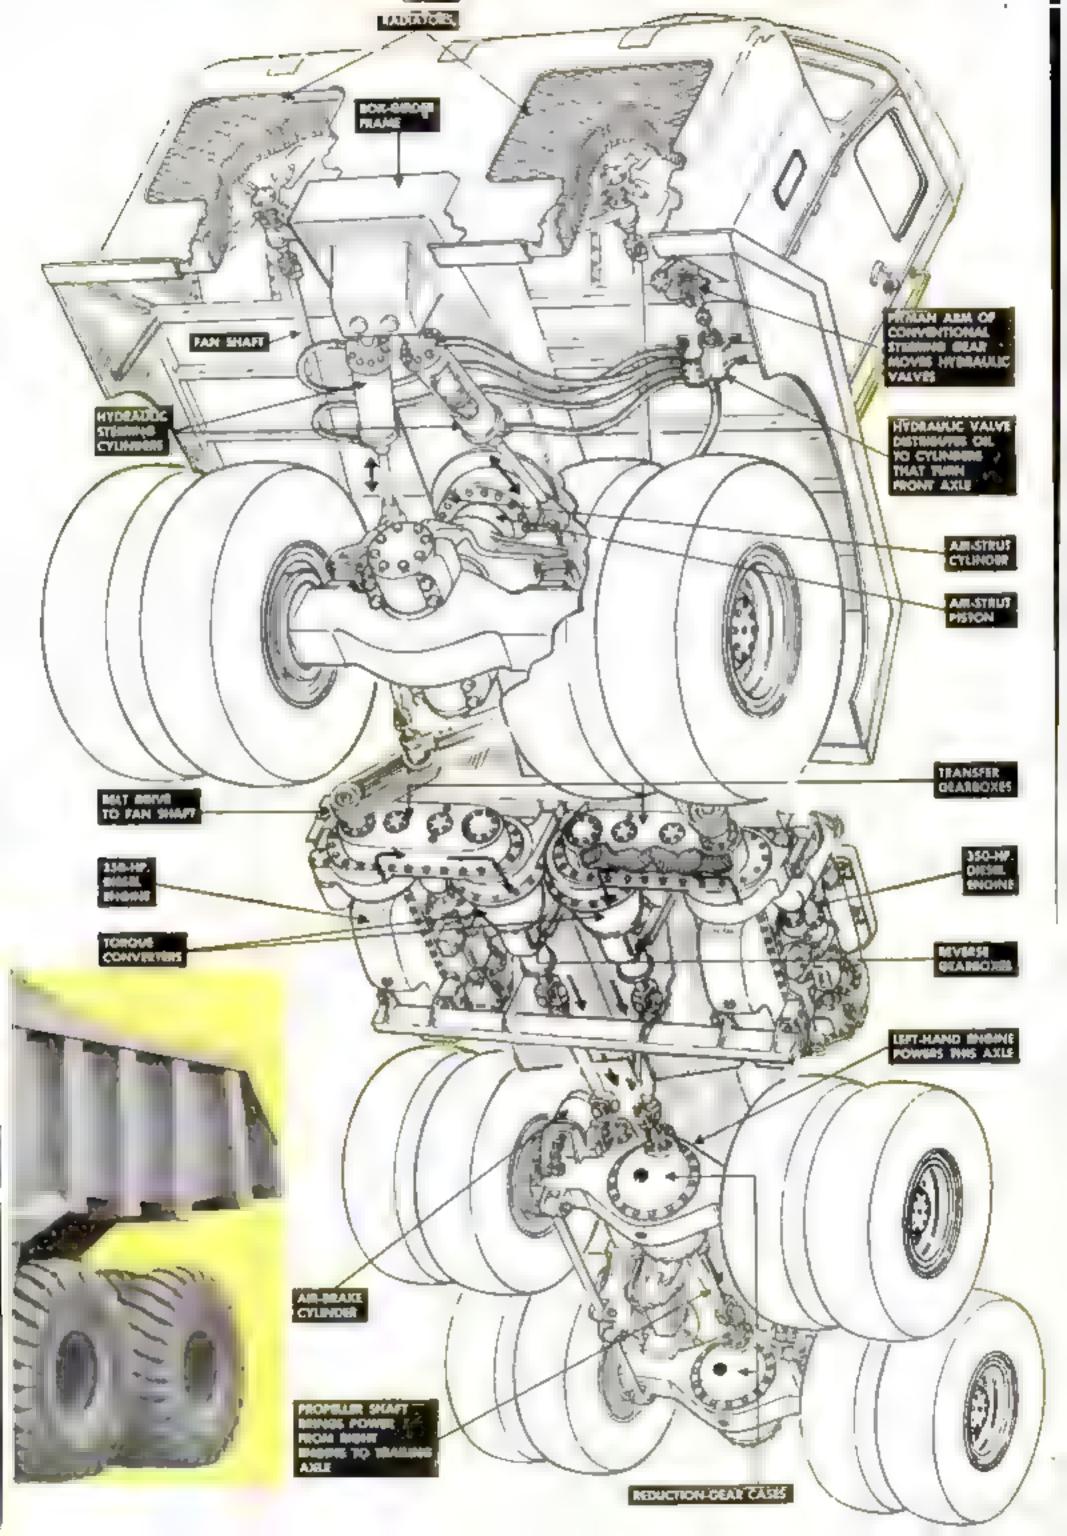

I HAD a lot of fun the other day in a Kansas City sand-and-gravel pit, driving the world's biggest end-dump truck. I was in control of 50 tons of vehicle and 70 tons of sand, and it handled like a baby buggy. It was terrific.

The boys at the Dart Truck Co., who built the huge truck, proudly call it their Monster. In every dimension it is colossal, but it's as nimble as a midget. Its

astonishing agility is partly the result of power steering and partly due to the mighty twist that 700 horsepower, assisted by torque converters and highgear reduction, gives to the tandem rear axles.

The Monster's mammoth proportions —32 feet eight inches long, 11 feet 8% inches wide, 11 feet six inches tall—alone do not make it a world's champion among

LIKE THE OLD PARLOR STOVEPIPE, the exhaust pipe from one of the Monster's diesels travels overhead, and, since the engine is reversed, vents in the direction the engine faces.

IF AN ENGINE OVERHEATS, or oil pressure drops, a pair of air horns on each engine (at upper right) set up noisy warning. Gauge I'm examining is tachometer used for tests.

end-dump trucks. What wins the Monster its title is its carrying capacity, which is what counts in a truck.

The Dart company has been customtailoring trucks to specialized needs for 50 years. It says this big boy can haul 60 tons. That is an understatement. I found that it will haul 10 tons more than that with ease.

#### Tires Are Truck's Back Muscles

Apart from the size and ruggedness of its steel body, which is built like a battleship's, and the strength of its axles, the huge truck's capacity depends on what the tires will support. That is where the Monster's back muscles are—in a dozen 32-ply tires, 18.00 by 25 in size, inflated to 80 pounds' pressure. Each is five feet three inches tall and capable of holding up 20,000 pounds. Add them all up and you have a carrying capacity of 240,000 pounds. The truck itself weighs close to 100,000, so you can pile 140,000 pounds of eargo on its back.

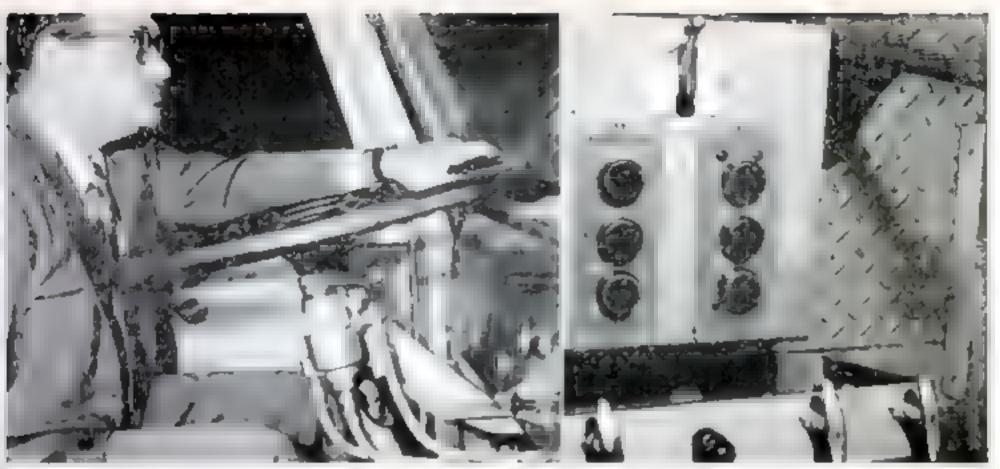

If Mohammed refused to come to a particular mountain, it wouldn't take the Monster long to bring the mountain to Mohammed.

As a matter of fact, the truck took off for the mountains shortly after I drove it. It was the first of six ordered by the Bagdad Copper Corp. of Arizona. It is now hauling copper ore from the bottom of an open-pit mine to the rim. It must climb 20-percent grades with a full load and achieve a top speed of 20 miles an hour over a route that doesn't exceed two miles.

With 70 tons aboard, it marched unhesitatingly up 12-percent grades for me and easily ran around the floor of the sand-and-gravel pit at 20 miles an hour. It couldn't have been more fun to pilot the USS *United States*, and I'll bet its driver on the job feels the same way about it.

Getting it out there was quite a project in itself. After all, the truck was illegal in almost every particular on the open highway. Kansas refused to let it set a single tire on its roads, even empty. So the Monster went west by train, bulging a foot over the edges of the flatear on which it rode.

The giant truck's front end rides on captive air, in a massive hydraulic strut similar to those on the landing wheels of bombers and big commercial airliners. The strut rises straight up from the center of the front axle, its upper part half in and half out of the cab. The truck's

FEW ENGINE GAUGES are necessary. There are two to record torque-converter temperatures, two to show are pressure, and an anumeter. I mergency brake is beside my right knee.

PUSH-BUTTON CONTROLS on the floor beside the driver's seat operate air valves that cause a jaw clotch to lock the input and output shafts for going forward or backward.

GETTING RID OF 70 TONS is an easy matter. Those hydraulic hoists exert 170,000 pounds

of push. Two engine-driven pumos supply pressure for hoists and power steering.

engines are mounted off a single backbone, much as John Cobb arranged the engines on the car with which he established the present land speed record of 394 miles an hour. When the truck takes a curve, the whole front axle pivots, instead of the wheels, like the front axle of a million wagons, including your little boy's.

The engines, two 350-horsepower Buda Super diesels, are mounted annulships, on either side of a huge box frame. This frame contains the 250-gallon fuel tank.

The engines, two of the largest built for trucks, were put behind the cab to give the driver better visibility and keep

him away from their heat and fumes and noise. Each engine drives a separate rear axle—the right-hand engine turns the rearmost, the left-hand engine the foremost.

But, to concentrate the power-plant components and their weight amidships, the designers decided that the engines and torque

converters must be side by side. This meant that the engines would have to face backwards, and so they do. Power is taken off the rear (output shafts) of the engines by transfer cases, whose gear trains carry it inboard to the input shafts of twin torque converters nested parallel to the engines.

The problem of driving fans behind the radiators, which are up front and 12 feet away from the engines, was handled by belt-driving two shafts from the trans-

fer case.

#### Triple-Stage Torque Converters

The torque converters are triple-stage, containing a kind of sandwich of three turbine impellers with stators in between the first and second and second and third turbines. At "stall speed," which is 1,700 r.p.m. on the diesels, the converters multiply engine torque five times. The over-all gear reduction in each rear axle

is 20.6 to one. Therefore, at stall, you have the staggering torque multiplication of 103 to one

Behind each torque converter—and I mean in the direction of the truck's rear—is a simple reverse box, providing one-to-one forward and one-to-one reverse ratios

The drive shafts extend backward from the reverse boxes, one to a primary reduction gear on the foremost rear axle, the other to a primary reduction gear on the rearmost. The drive wheels are planetary, providing a five-to-one gear reduction in themselves.

An interesting feature of the torque

converters is that they provide a considerable downhill - braking effect—a maximum of 520 brake horsepower, the engineers told me. You see, when you let up on the throttle suddenly and start down a grade, the turbine impellers are still whirling rapidly, and they, in effect, try to drive the idling engine

impeller, which is impossible. As a consequence, a tremendons turbulence is created inside the converters, and the torque is applied in reverse, giving you a very noticeable braking effect.

I didn't dare rely on this at first, with 70 tons behind me, preferring to apply the air brakes, which have a total brake-lining area of 2,550 square inches and really bind the Monster down. But when I finally let the torque converters hold back the truck on an incline, I was amazed at how well they did the job.

Steering the Monster is so easy that I'm sure my wife could do it. You have to exert about as much effort as it takes to steer a medium-size passenger car that doesn't have power steering. The massive truck's hydraulic boosters apply 56,000 pounds' pressure to assist you.

As I said. I found the Monster a lot of fun. If you'd like to have one to play with, though, it'll cost you \$98,500. END

MONSTER'S GRANDDADDY above, born in 1903, was first Dart truck. Its engine was also located to rear of driver.

Instead of getting out of your car to open this garage door, you would gently nudge the bumper against the hunged bottom panel. This would move the panel in-

ward and telease the door eatch from a projecting stud holted to the floor. Counterweights would then lift the released door fully open. Bottom panel could be locked to keep door from opening accidentally.

2 Boat Handle to Grip Oar Bracket. It's not the weight but the awkwardness that makes it so hard to beach or earry a rowboat. This handle would eliminate the awkwardness. A wire bail, fitted with a wooden handle, would slip into each oarlock bracket, making it possible for two men to balance the weight comfortably.

3 Pliers to Straighten Bent Nails. The usual method of straightening nails often yields more dented fingernails than straightened iron ones. There'd be no hazard, however, if you did the job with pliers like these. Notches in the jaw and near the lever pm would grip a nail firmly and keep it from twisting while you pressed it straight.

## MORE New Ideas from the Inventors

4 Humming Fly to Attract More Fish.

I sh can be ar, vive the inventor of this double-acting fore so he proposes to make artificial these somal as well as book like the real things. An electric valuator produces an insect-like hozz which is carried through the rod and line down to the bait.

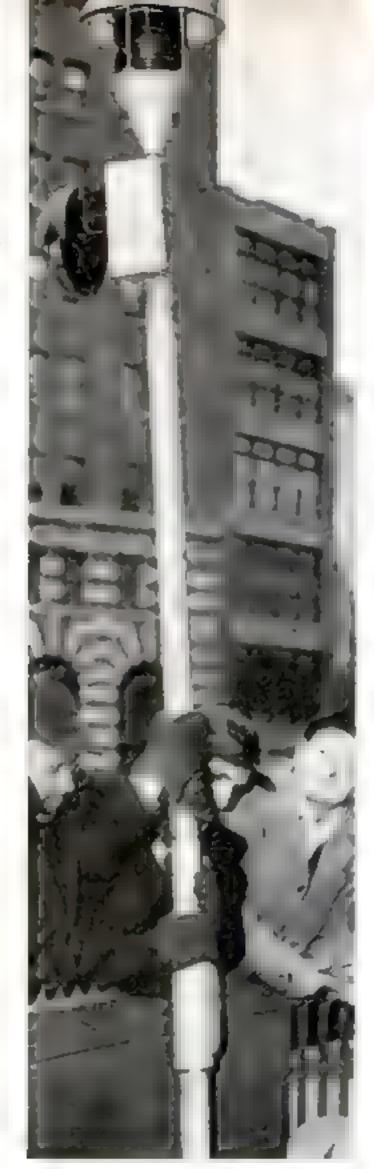

5 Plastic Umbrella to Pump Up. This ribless imbrella would blow up like a balloon. Deflated, it would be small enough to bt in your cont picket. The three-section telescoping handle could be adapted to pump ar bet your the welded plastic sheets that form the militable comps.

6 Drive-in Signal to Show Vacancies.
Care wouldn't have to croise around a drive-in if the theater had signals to show vacant locations. Indicator lights would be

Connected to switch is on the speaker posts. When a speaker was litted, the corresponding signal would blink off. If all speakers in a row were in use, "I till sign would light up-

#### Subway Alarm Calls Cop

A DESERTED subway station is a mighty lonely place to face a thug. The alarm pole being installed above at the entrance to a New York City subway lets the man in the change booth call for help. A push on a pedal flashes a light, clangs a bell—and brings the nearest policeman on the double.

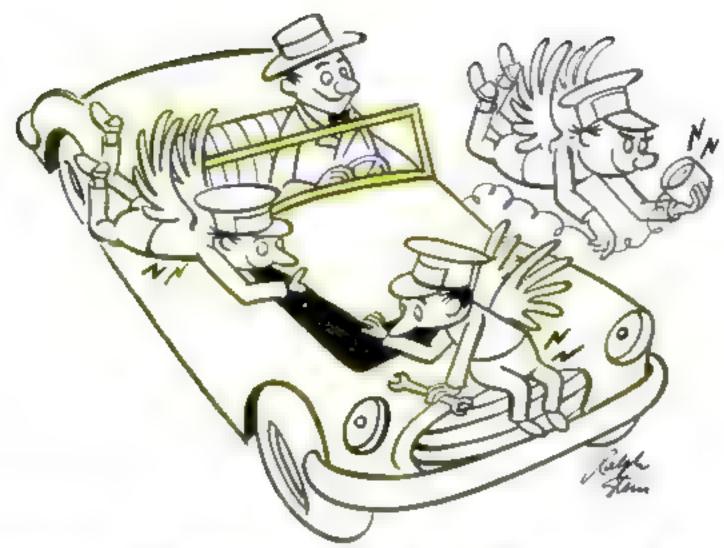

#### There Are No Strings to This Piano

The musician above is playing a German instrument that has a keyboard like a piano but produces sound the way a glockenspiel does. Instead of vibrating tant wires, the tiny hammers but against metal bars made of a special alloy. It's called the Campanella and sells abroad for about \$236

#### Oxygen Bar Gives Workers Fast Pickup

AT THE Livestock Exchange in Omaha, weary stockmen are suiffing oxygen for a lift. Inhaling the gas 25 certs for cone-minute charge—is said to give a cooling sensation followed by a feeling of biovancy that lasts from one to three hours.

# Clever Teamwork Guards Your Car's Electric System

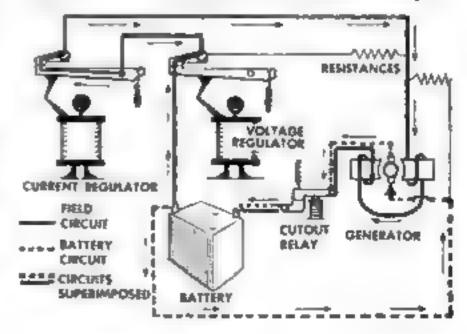

PROBABLY you have never thought of your car as an electric power plant on wheels. But the combined generator capacity of our 40 million passenger automobiles is more than seven million kilowatts—or nearly one-fifth as great as the total capacity of all of the electric power stations in the United States.

In the big hydroelectric and steam-electric generating plants, technicians called load dispatchers keep an eye on the constantly changing power needs of our cities and rural areas. From minute to minute they balance these demands with just the right amount of electricity.

Your car has a load dispatcher, too, or more correctly, three load dispatchers, all housed in a little box attached to the generator. Each is an electric switch, or relay, wired to its companions in such a way that whether your battery is weak or strong, or the engine is racing or standing still, with half a dozen electrical apphances cut in or out, your generator output is adjusted instantly. -Henry B. Comstock

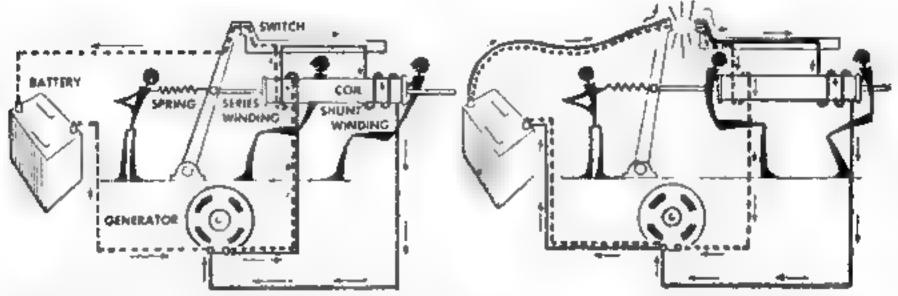

### **Current and Voltage**

working with the cutout relay are the current and voltage regulators. Their action is intermittent, and either may open and close as many as 250 times a second to maintain balance between the electrical demands of your car and its generator output, Both relays reduce the output by cutting resistance into the generator's field coils. In the drawing below, they are idle, allowing full current to flow through the field. Generator is now producing maximum output.

### Cutout Relay Is the Captain of the Three-Switch Team

ACTING as a one-way electrical valve, the cutout relay allows current to flow from the generator to the battery, but prevents the battery from pouring current into an idle generator. Without the cutout relay, battery feedback would burn out the generator and run down the battery charge. Two drawings below show how two-coil relay works.

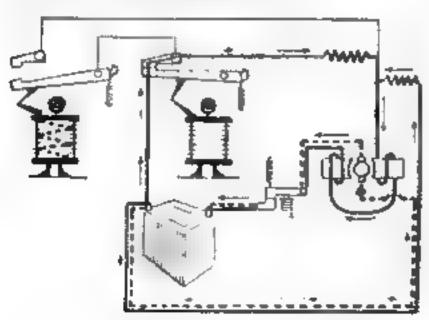

DIRECTION OF CURRENT flowing around its core determines the polarity of an electromagnet. For this reason the cutout relay has two windings—one clockwise, the other, counterclockwise. When generator output is strong, electricity passes through both coils, but in the same direction (see arrows). Resulting strong magnet overcomes tension of spring and closes switch points, completing circuit between generator and battery. Current now charges cells or runs equipment.

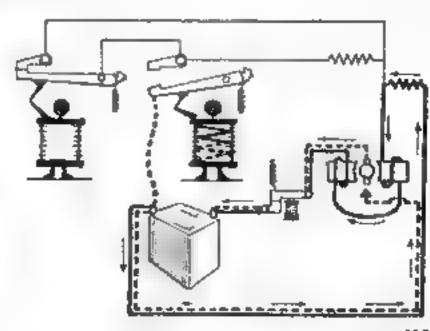

BATTERY sends current back through cutoutrelay switch contacts when generator is idle. Beyond the switch, current divides to feed both series and shunt circuits. Its flow is now in opposite directions through the coil windings. This neutralizes polarity of the magnet, and the spring opens the switch. No more current can flow from battery to generator. Shunt winding closes switch contacts again when generator goes back to work.

### **Regulators Control Field Strength**

WHEN BATTERY IS LOW, or power drain is heavy, your generator overtaxes itself to meet demand. Current regulator responds to heavy power surge and opens switch, shutting off normal generator field circuit. Two resistance circuits now feed somewhat less current to the field, reducing generator output. Current-eegulator magnet loves grip on switch, and normal field circuit is restored. This cycle is repeated intermittently, to stabilize current output.

with naviery approaching futt charge, voltage increases as generator tries to force more current into the cells. Thus automatically lowers current output, which is good. But high voltages will damage car's electrical system. Voltage regulator responds to increased "pressure" and cuts out one resistance circuit. Remaining resistance circuit can pass little current to the generator field. Now, both voltage and current output are lowered.

# P.S.

## Last minute news & notes...

CHEAPER WAYS to diagnose polio are in sight. Alabama scientists have succeeded in growing in mice the third of the three known polic strains. This may also help develop a new vaccine, since the polic strain seems to lose its virulency after going through mice. Dentists are catching gum and tooth troubles earlier by using black light that shows up symptoms ordinarily invisible. They're also studying the use of ultrasonic waves to drill teeth for filling . . . In industry, ultrasonics have been put to work finding invisible cracks in huge steel parts -- flaws distort the sound waves passing through the metal. . . And a Scots professor says he can mature Scotch whisky in one day with ultrasonic waves. But you must drink fast -- it goes raw again in a few hours.

1953's TRUCK DRIVER OF THE YEAR.

Pat Burkholder of Sparks, Nev , has driven more than 1,500,000 miles without an accident--equal to 150 years of ordinary driving. He has risked his life several times to save motorists injured in crashes.

Machines Cut Hours for U.S. Farmers		
CROP	1940	1953
WHEAT (100 BIL)	ANAN-HOURS	A A A A HOURS
(Dec (Dec UL)	ARARAKA B3 MAN-HOURS	ANAN MAINTEN
CETTON () BULLE)	ÁÄÄÄÄÄÄÄÄÄÄÄ ÄÄÄÄÄÄÄÄÄÄÄ	ANAXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX

THE WELL-DRESSED CAR today has nearly three times as many light bulbs as in 1940--38 of 'em . . . Doctors blame "blackouts" for a lot of auto accidents--say such sudden fainting spells are caused by emotional stresses, fright, bad heart conditions. Anyone with a sensitive carotid sinus should beware tight collars: turning his head to park may black him out . . Drive-in theaters are having windshield problems. Tinted glass spoils color films, while curves partly depolarize 3-Ds.

EARTH'S LIQUID CORE. an English physicist believes, has jet streams and swirling currents similar to those in the upper atmosphere. This would explain irregular rotation of the earth and rapid changes in earth's magnetic field . . . "I Dreamt I Dwelt in Marble Halls" may become the atom scientist's thems song. Marble slabs are said to shield radiations as effectively as lead--and they're cheaper.

NEW SYNTHETIC RUBBER reported by Goodyear combines the top qualities of all present major types. Called polyester rubber, it's said to be 50 to 100 percent stronger than any other, to wear twice as long as the best cold rubber, equal the best inner-tube rubber for holding air, match neoprene in standing up against oils.

LAST STRAW for engineers working on auto air conditioners: Chrysler reports that, aside from the sun beating on the car roof, the high engine-compartment and exhaust-system temperatures, and the heat reflected from sun-baked highways, there's also a substantial amount of heat radiated by the human body. Six people in a sedan create enough heat to welt about 20 lb. of ice per hour.

BOSTON UNIVERSITY has found a way to process aerial photographic files in a single bath. Development and fixing chemicals are carefully balanced. . . . Rug makers say new chemical treatment of synthetic carpet fibers makes them so dirt-resistant they last much longer.

# Pictures Show Errors in the Use of Circular Saws

RIGHT EYE

GREEN

#### By Harry Walton

THE circular saw is the top tool on many a home craftsman's list, and rightly so. You can do a lot with it but, like anything else, there's a wrong and a right way.

Here for the first time are pictures that make the most common mistakes stand out before your eyes. The saw, the work, the accessories and even the tie no well-dressed craftsman should wear pop right out from

## Three Ways to Make Your Own 3-D Viewers

50...OUNGE CELLOPHANE. Many candies and o her edibles come wrapped in colored cellopia ic. You can also buy it as gift wrapping. Look for a deep red and medium green. If colors are light, use two or three thicknesses. Avoid wrinkles, which impair transparency.

DIP DUD SILM. What photographer hasn't some blank, developed film on which the camera shutter never clicked? Add 40 drops red (or green) food color to ¼ cup warm water. Dip the film until sufficiently deep in color, testing as explained in the text.

JELL YOUR OWN. Dissolve an envelope of unflavored dessert gelatin in three oz. warm water. Heat in double boiler until dissolved. Add seven drops of food dye to a tempoonful, and pour carefully onto enameled jar lid. Let harden 24 hours before peeling off.

MOUNT IN FRAME. With carbon paper or by making pin pricks at \$\frac{1}{4}\$" intervals, transfer the viewer pattern on page \$141 to thin cardboard. Cut out two frames and cement your cutout filters between them, the red at \$left\$, the green one and finger tab at right.

# Circular-Saw Blunders in

3-0

Are you sharp on power-saw savvy? Try to pick the boners before reading photo captions.

STEREO PHOTOS BY NUBERT LUCKETY

red filter. They should disappear. The green type will not varied to be build by when seen through the paper.

If you're tempted to wait and Joing home a viewer from the next 3-D movie you see could bother. It will have Polaroid blees, made for viewing pictures projected by polarized light. Such a viewer will not show any stereo depth in the red and green composite pictures on these pages. It's elsy and rewarding to make your own viewer. You, your family and friends will enjoy seeing these pictures come alive with startling 3-D realism.

Viewing them involves no eyestrain or special effort for normal eyes. Place the page squarely in front of you in a good light. Hold the viewing specs with the green filter in front of your right eye—and there you are.

Fonce goes on outboard support of this multipurpose tool. Watch at fence to guide work. On other saws use a roller support. If fence cannot be used, champ wood strip under work. Guide strip against edge of saw table.

#### **Dangling Cotton Shoos Flies**

Some people swear that a wad of cotton on a screen door repels flies. Others deny it. I say the cotton should be hung from a thread. Breezes, or the opening of the door, make the cotton swing and scare the blue-bottles even if they are feasting on kitchen odors. Another dodge is to put a light aluminum vane on the thread. Any breeze makes it twist the cord up; when there is no breeze the cord unwinds. Both ways flies are foiled.—Hi Sibley, Nuevo, Calif.

#### Tire Chains Make Quick Ladder

AUTO-TIRE chains make a handy ladder for garage, barn or attic trap door and can be quickly taken down when the snow flies. Narrow wood spreaders, notched at the ends, are inserted above every other cross link to hold the chains apart and form steps.

—I. R. Johnston, Dallas, Tex.

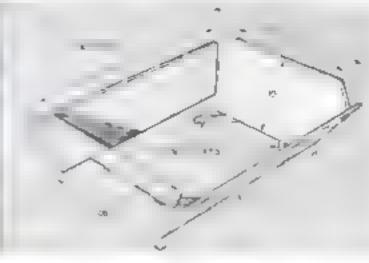

## Screening Becomes Scouring Pad for Drill

CHARRED pans can be quickly cleaned with an electricdrill scouring pad. Remove one bead from a wood spool and tack on several turns of wire window screen, letting the screen overhang. A bolt held on by a nut forms a shank.

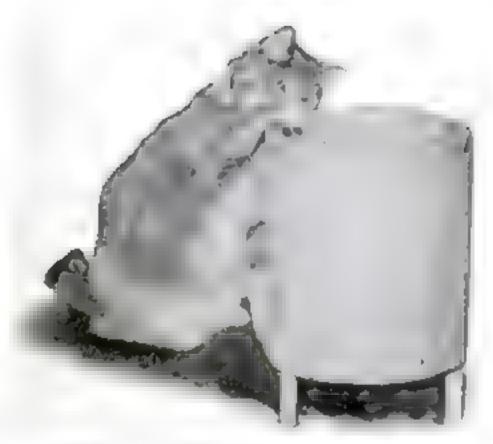

## Sideboards Triple the Load of a Tray-Type Wheelbarrow

IF Your wheelbarrow is the tray type, you can triple each pay load of leaves or grass cuttings by knocking together a simple wood body. One built to the dimensions

shown should fit most barrows. Space the cleats to book under the rim of the tray and hold the body in position.—John W. Aberle, Saratoga Calif

# This Wastebasket Is Washable

HERE'S a canvas wastebasket that can be whisked off its frame of natural-finish wood and tossed into the washer with the rest of the family laundry.

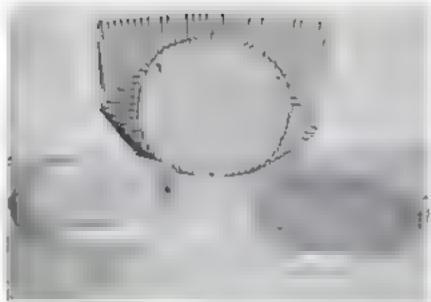

Frame. Glue the rings together so that the grain is at right angles and drill three holes in the lower ring to receive the turned-down ends of the legs. The 9" disk of %" plywood braces the legs and serves as a hard bottom for the basket.

Canvas Cover. Cut striped ticking to size and stitch braid of contrasting color along the bottom edge. Fold over a top hem and sew. Baste bottom to side and sew side seam, continuing around the bottom over basting. Turn the cover right side out and insert drawstring in top hem. Cut three %" holes in the bottom to fit over the legs and reinforce them with double rows of stitching. Insert the drawstring in the top hem, slide the cover over the frame, pull the drawstring through the %" hole in the ring and knot it.—John Rogers, Dallas, Tex.

# Matchbook Sharpens Knife

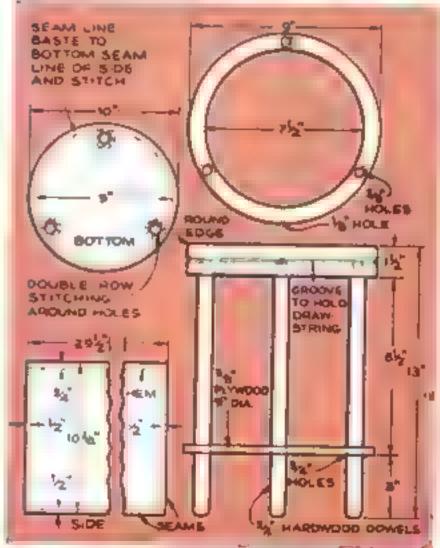

SMALL modeling knives can be sharp-ened on the abrasive striking surface of a matchbook if you don't have a sharpening stone. Just rub the blade across the surface several times.

FRAME AND COVER are ready for assembly above. Hard-wood dowels are turned down to 3," at one end.

ASSEMBLY. Donels are glued into ring, plywood disk is slid up on legs and held in position with brads,

# Cupboard Latches Are Hidden

Modern knobless cupboard latches can be made by drilling small holes in the doors and mounting spring catches on the inside. Poke your finger through the hole to flip the latch

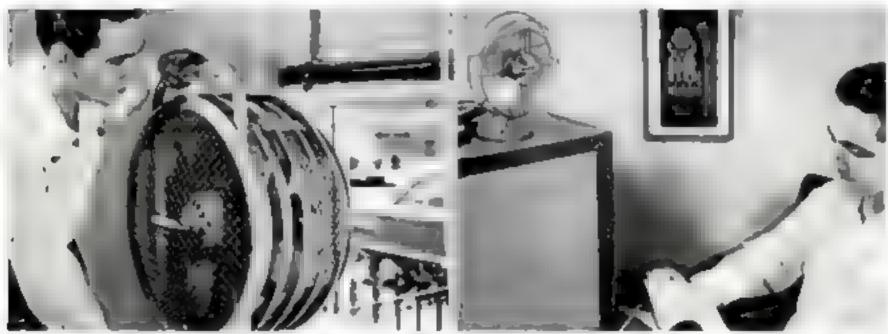

48 POPULAR SCIENCE

When the thermometer sours, do iced drinks and cold foods make your body cooler—or are you really warmer?

# Can You Beat the Heat?

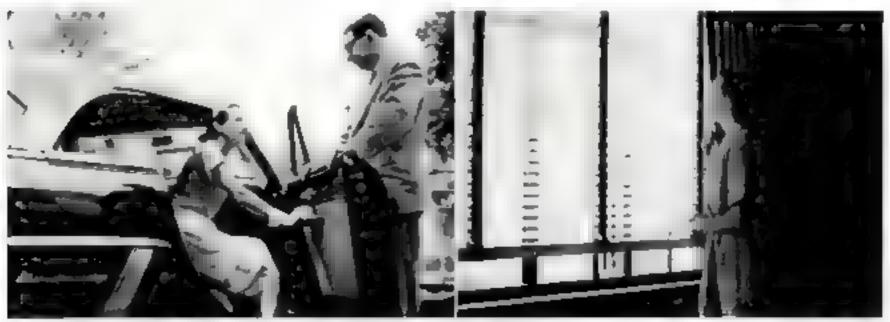

## By Kenneth M. Swezey

EVER since Persian kings had slaves rish snow down from the mountains on summer days, people have been trying to beat the heat. Through the years they have found some ways that work—and some that don't. Here are popular ideas about how to keep cool. If you can answer the questions correctly, you're a long way toward knowing how to handle hot weather. Check your answers on the next two pages.

2 Are fans that pull in our through one window and blow it out another effective when the temperature is higher outdoors than in?

3 Does the breeze from an electric fun cool your body directly, or does it do so by first cooling the air in the room?

4 Are light-colored clothes really cooler than dark-colored clothes, or is the effect largely psychological?

5 Will your home keep cooler during the day if you close your blinds (or draw your shades) or if you leave them open?

# Answers to Quiz on Preceding Page Show

# How You Can Beat the Heat

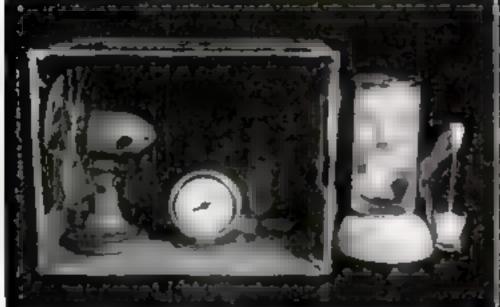

Here's the low-down on the best ways to keep cool— and some simple home experiments that show you why they work.

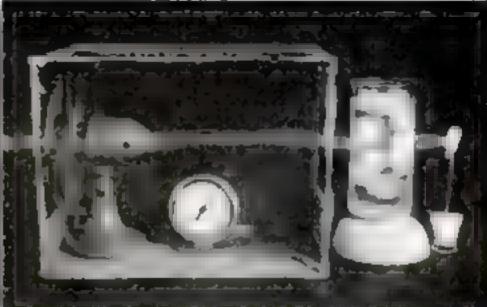

Ley food and drink may make you feel temporarily cooler, but in the long run make you warmer by lowering efficiency of your body's cooling system, as shown by infrared photos at left. In hot weather, extra blood is pumped through veins and capillaries near the surface of your skin (far left) where it is effectively cooled by radiation. convection and evaporation of perspiration. Photo at near left shows how a cold food pulls blood away from the skin surface to the stomach, where the cooling area is smaller, so less efficient.

2 fane that pull in outside air are effective only when the temperature outdoors is lower than indoors. Otherwise you will heat your house instead of cooling it. To get the best cooling with these fans, they should be turned on after sundown, when the outdoor temperature drops, and left running until morning. During the day, the windows should be kept closed and the fans used like ordinary room fans to circulate the air that has been trapped during the night.

How such fant help beat nummer heat can

be demonstrated as below with a model room made from a carton with an open window cut in each end and having a cellophane side through which you can see what happens. When the fan directed out the window is not running, it is still hot within the room even when the air outside one or both windows is chilled by means of a container of ice water, as shown in left-hand picture below. Turn on the fan, however, and the cold outside air is pulled right into the room, as shown in right-hand picture below, where it quickly lowers the temperature.

[50 POPULAR SCIENCE

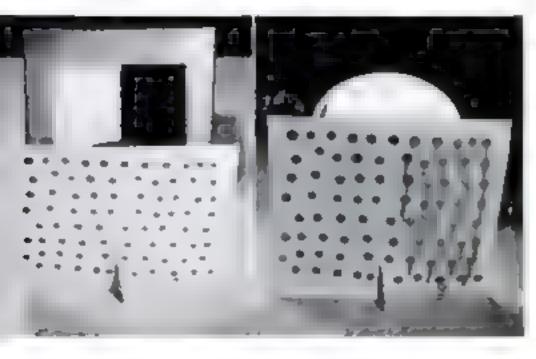

3 Odd as it may seem, the breeze from a fan does not actually cool the air in the room. It cools your body directly by carrying away heated air next to your skin and by speeding up the evaporation of perspiration. If you are skeptical, here's

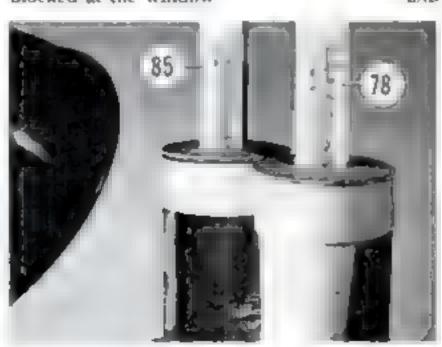

a stunt that will prove it to you. Set up a thermometer between a still fan and you, as shown in the left-hand picture above. Then turn on the fan and watch the thermometer. As shown

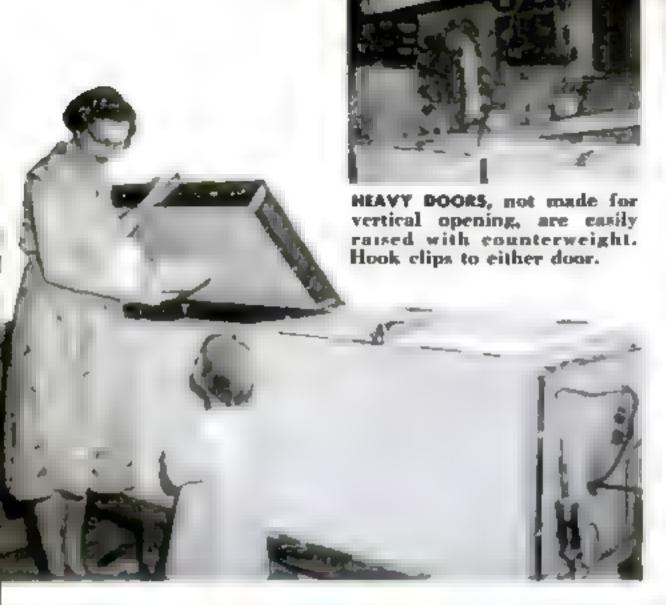

in the right-hand picture above, the reading on the thermometer does not drop a single degree even though the breeze from the fan makes you feel much cooler.

Under direct sunlight or intense artificial light, light-colored clother are cooler than dark-colored clothes of the same material because they absorb less radiont heat. Here is a simple test that demonstrates the principle involved. Blacken half of one side of a sheet of thin white cardboard, as shown in the nurfor reflection at left below, and dot the other side with drops of candle wax. Prop this sheet on edge and direct the light from a photoflood bulb in a reflector toward the black and white side of it. The heat absorbed by the black section will quickly melt the dots opposite it, while the dots opposite the white section will still be firm, as in the picture at right below. Incidentally, this is true only under direct light. Some experts believe that in the shade white clothing is really hotter than black because it slows the radiation of your body heat, an essential part of the process by which your body tries to keep cool.

**Tour house** will stay cooler if you close I the blinds in windows that face the sun, When radiant heat comes through the window glass, it is absorbed by walls and furnishings. But they are heated to such low temperatures, that they cannot radiate much heat back through the glass, so much of it heats the room air. You can demonstrate this "greenhouse eflect" with the two glass jars shown below, (wathirds hard with dark paper to represent the walls of a room. The "window" left by the gap in the paper is closed in one jar by a light paper "shade"; in the other, left open. Thermo a ters are inserted through slift in the cardboard covers, their bulbs shielded from direct light by paper around the jar tops. The air temperature in both of the jars starts the same. But wh m the light is truned on, the temperature in the far without the shade clumbs much faster than it does in the jar where the radiated heat is blocked at the window

# How I Built My Food Freezer

Two old refrigerators, bought for \$1 apiece, keep 450 pounds of eats at a chill 4° above zero.

I WANTED a freezer, but the size I needed they don't sell in dime stores. Now, by combining two old refrigerator boxes and some secondhand parts, I have a 13-cubic-foot freezer that'll hold 450 pounds of eatables. The kids can have ice cream in August and strawberries in January, and if anyone ever sends me a steer I'll know just where to put it. For about \$80, I figure I've got a freezer that equals a \$400 commercial job.

foining the boxes. These are two junked 6.4-cubicfoot GE refrigerators, laid on their backs with the tops removed and the open ends facing. The photos show how I lashed them together with steel strap and a jack

Some boxes come with a flange on top that makes them hard to join, so I made sure to get two with flat edges. To make the doors open on the same side, one had to be reversed. I then mounted the boxes on a wood frame, about 14" high, to bring the top of the freezer up to 36". This makes it easy to reach in without bending.

Hooking it up. A %-hp. motor drives the compressor to circulate the Freon. From the compressor I ran %" tubing to the receiver tank and from there to the expansion valve that sprays the Freon into the freezing plates.

The system was charged with about three pounds of Freon by pumping a vacuum and letting it draw the Freon in. Temperature is controlled by an old bellowstype pressure valve that keeps the chill down to about 4° above zero.—Leon Levine, Brooklyn, N. Y.

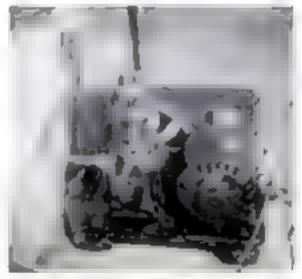

JOINT BETWEEN BOXES was made arright with strip of 12" sponge rubber cemented to one edge. Inside seam was covered with Fiberglas for insulation where boxes had none.

AUTO JACK and looped cables were used to squeeze boxes tightly together for joining. Then seam was covered with steel strap, put on with self-tapping screws.

FREEZING PLATES and expansion valve (in corner) are only new parts, cost about \$50. Plates were bought to nearest size, then acrewed to inside of freezer on all sudes.

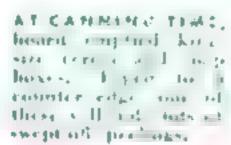

COMPRESSOR, motor and condenser (in background) came from old refrigerators, cost \$5 in all. Thermostat on box (upper left) sounds warning buzzer if temperature rises.

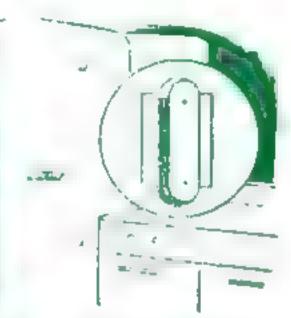

# KEEPING THE HOME

SHIPSHAPE

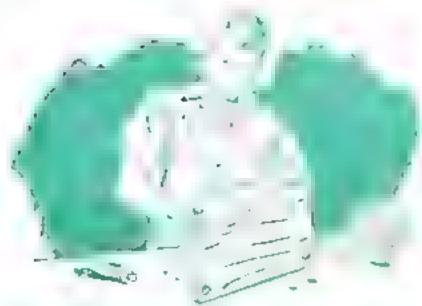

ABD A PAPER GRIP to the actit of your charso you can read outdoors without sprinting over the lawn on which days. Spring type severa door catcle will do the trick.

of it MCSTS INTERFERENCE when opened, a retrial electric translate protected with a rubcoper cent-ated to an adace harger.

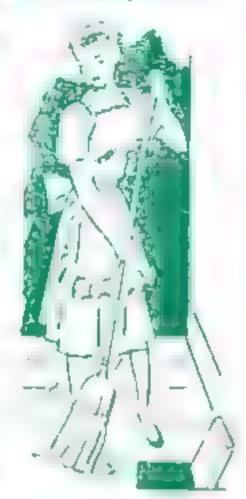

A CREEPING CUTTING BOARD slows down salad makers. Rubber washers concerted at each corner will hold the board steady and keep a from marring work surfaces.

A DUST SOX under your kitchen floor is handy for sweepings. (at a tile size trup door in a corner. Pout it to upon with pressure.

CHECK RADIO OR TV DIN during opense indox season. If not a dot on the cabinet and the did after timing the -rt while an outdoor hytence rhecks and okays volume. Here you if never blast at neighbors.

A SLIDING TRAY, made like an egg crate and riding on record-player tracks in handy for bottled drinks. Fit it to the cabinet nearest the refrigerator,

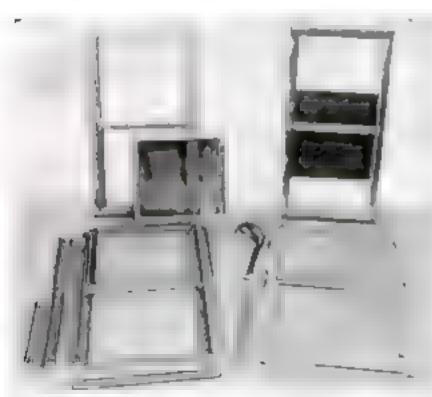

TOO FAR TO THE ALARM CLOCK? If there's no room for a bedside table, mount half a chopping bowl over the bed. Add a top cut from thin board and hang as shown.

1. Colored Blocks Need No Paint. You can now build a wall in color. Precolored concrete blocks are already finished for you with a hard, bright, washable coating that won't crack, mar, mildew or let moisture through. The finish comes in 20 colors in either a smooth gloss or a rough texture that helps deaden sound. For interior partitions, you can get blocks that have a different color on each side.

2. Storm Sash Comes in Kits. You supply only the glass and screen to make these combination storm-screen units. Everything else needed—frames, fasteners and hardware—comes knocked down, ready to assemble with a few tools. The frames are available in both redwood and aluminum, and come in standard sizes.

3. Tints Match Paint. You can have rubber-painted walls, glossy woodwork, enameled cabinets, flat-oil ceiling and painted masonry—all exactly matching with these new tinting colors. The colors will mix with any paintwater, rubber, oil, alkyd-resin, varnish and cement-and are simply added in equal amounts to a white base to get duplicate shades.

4. Switch Plate Hides Plaster. Broken plaster around an outlet box that isn't covered by an ordinary switch plate can be easily hidden with this special large-size plate (right above). The 3%"-by-5%" plastic plate comes in ivory and brown, takes standard mounting screws, and is also made in a double-socket type.

5. Strip Seals Tub. Cracks around bathtubs, sinks and other plumbing fixtures can be quickly made watertight with this flexible plastic strip. Cemented in place, it forms a smooth, concave joint between wall and fixture, shedding water so it can't collect at the crack. It comes in 15' lengths with separate elbows and end pieces for fitting corners and edges.

# New for Your Car

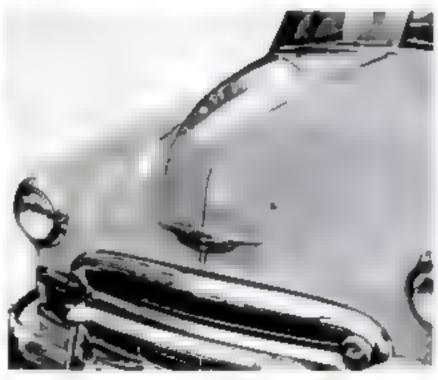

1. Sleeping Tent Hooks to Car. Taking up little room in the lug gage compartment, this canvas shelter can be set up in a couple of minutes to serve as a picnic shelter or for overnight camping. One side hooks to the car's rain gutter, while the other is held by nluminum poles and guy lines. At night, three side curtains roll down and zip together to form a two-cot sleeping tent. By adding extra poles, you can make the tent stand by itself so the car can be detached for trips away from camp.

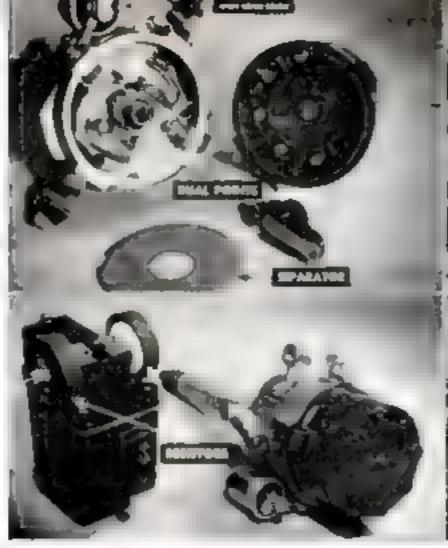

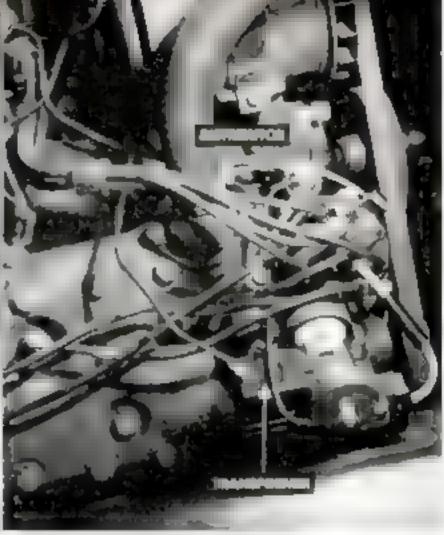

2. Squeegee Seals Car Window. Quickly mounted outside a side window, this accessory acts as a squeegee when the window
is raised or lowered, serves as an arm cushion when the window is open, keeps the
window from rattling, and seals out rain
and drafts. Called "Windomatic," it consists of rubber attached to a stainless-steel
mounting strip. Two sizes adjust to fit any
window. As a squeegee, it cleans the glass
when the window is raised or lowered.

3. Molding Gives Custom Look. Chevrolet owners can give their ears a bull-nose look with little effort. This customizing molding goes on in place of the original unit without welding, drilling or cutting. Made of polished stainless steel, the molding extends from windshield to grille and can be used either with or without the Chevry insignia. The accessory fits any Chevry from 1937 on. A similar customizing unit also is available for late Fords

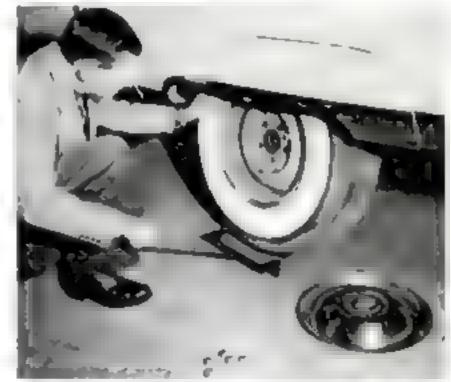

4. New Coll Works Like Magneto. This new magneto-like ignition system gives a long, high-intensity spark at high speeds without the magneto's weakness at low speeds. It consists of a special twin-primary transformer and a dual-point distributor. The first of the two primary windings, instead of collapsing quickly and producing a short spark, is opposed by a current build-up of opposite polarity in the second

winding. When the circuit is interrupted, there is a reversal from positive maximum to negative maximum, producing a spark of long duration that improves combustion. The system is said to reduce detonation, eliminate misfiring at high speeds, and permit from five to eight degrees more spark advance. The polarity reversal is also said to prolong plug life by reducing electroplating on the electrodes.

5. Kit Spruces Up Station Wagon. Refinishing kits for restoring the wood parts of station wagons are now on the market. Each kit contains sufficient materials for one average station wagon. Included are paint remover, wood filler, wood preserver, varinish, sandpaper, steel wool, scraper, brush and instructions.

6. Oil Plug. A restricted spark chamber and baffle that recess the electrodes are said to enable this plug to fire in old or worn engines that shoot oil and soon foul conventional plugs. The ground electrode is made of nickel. The shell is finned to dissipate engine heat faster.

7. It's Easier to Change Tires. Leverage applied with this lift makes it easier to handle heavy wheels when you must change tires along the road. Made of steel, it folds into a neat package for storage in the luggage compartment. A larger size handles truck wheels.

Further information on these products can be obtained from I. Into Cubana and Cartain Co. P.O. Bus. 222. S. rocate, N.Y.;

# Gus Peps Up a Tired Truck

By Martin Bunn

CUS WILSON was standing in the door of the Model Garage on a late August afternoon, wondering if he could close a rute curv and get in a bit of fishing at the lake when Glen Showalter drove up in his rattletrap later national truck.

Beside Clen sat pretty Enad Bishop, daughter of San-

# screwdriver to pry an obstacle from the path of true love.

Bishop, who ran a sizable grain farm a few miles out of town. Gus had known these youngsters from their beanie-cap days. He smiled up at them now with a broad grin, for he knew that Glen had been courting End for some time.

"You're looking prettier than ever, End," Gus greeted the girl. "Howdy, Glen. You

got trouble?"

"Trouble's no word for it." Glen's face was lined with worry. "I'm supposed to be hauling grain away from Mr. Bishop's combines, and this old tub won't pull the hat off your head. Been fighting it all week—ever since harvest began."

#### The Kid Doesn't Have a Nickel

Gus was on the point of asking Glen why he hadn't brought the truck in before, but he checked the words. Everybody in town knew the kid didn't have a nickel to his name. Glen had been reared by a widowed father, far up in the hills, on little more than a milk cow, a small garden, a pair of ragged overalls and a dirty shirt. The town had thought that the son would be like the

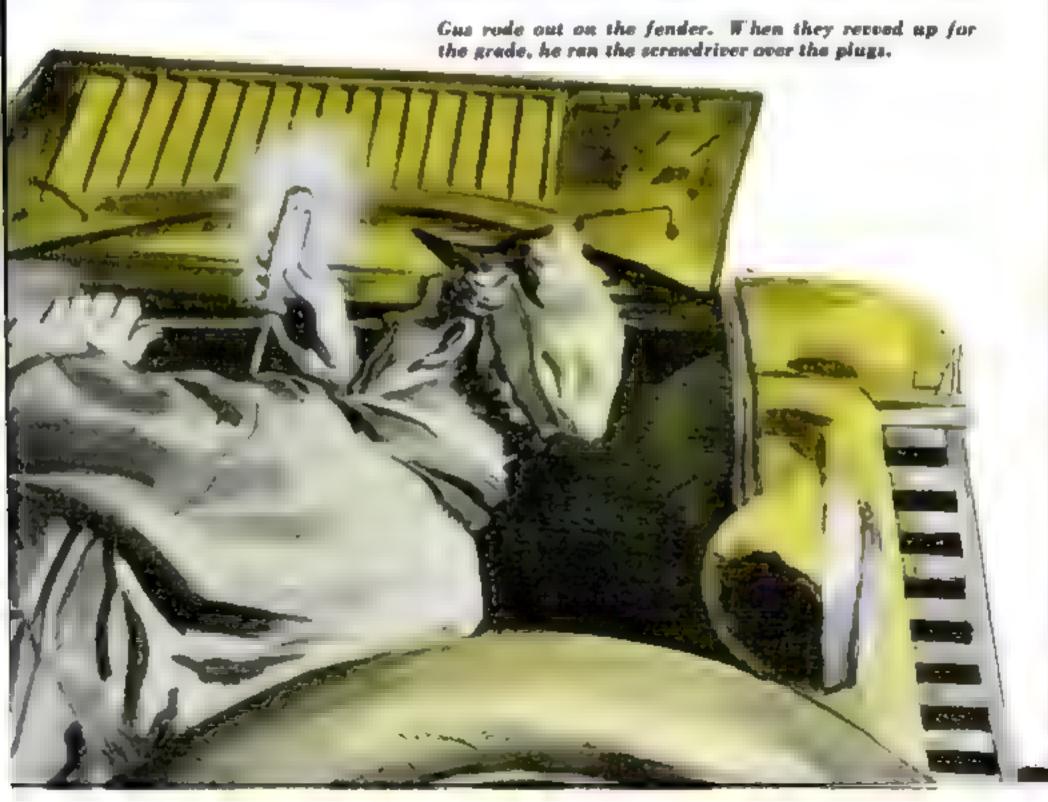

father-honest enough, but content to neither sow nor reap.

Enid Bishop had changed that. Now, Glen was making a desperate gamble to get into business. He had bought the old International for a few dollars down, worked half the summer to get it into shape to haul grain by harvest time, Kind-hearted farmers had seen fit to give the kid a break. If the track held together through harvest, Glen could earn enough to pay it off, trade it in on a better one, and gradually work his way into a year-round trucking business.

#### Dreams Are Riding on Battered Truck

If the truck didn't hold together? Gus looked into the eyes of Enid Bishop and had the answer. Two kids in love would find their dreams shattered. He cocked his ear to the motor, which was idling nicely.

"Sounds all right to me, Clen," he said.
"That's the tough part of it," Glen exploded. "I ground the valves, took up the bearings, installed new rings, and tuned her the best I knew how. She's all right on the idle, but misses to beat Harry when you

rev her up. No good on the pull. And she's got to pull temorrow, or I don't have a job."

"Don't worry about it," Gus reassured him. "We'll make her hit, or know the reason why."

"I won't be able to pay you until-" Glen

began.

"Forget it," Cus cut him short. "Your

credit is good here."

He was rewarded by the look Enid gave him as he lifted the hood. All this rig needs is a set of decent plugs, Gus told himself, as he removed a weird assortment of old ones,

put them in the sandblasting machine, and tested them under compression. To his surprise, none of them was

in bad shape.

While the plugs were out, Gus got his compression gauge and had Stan Hicks, his helper, turn the motor over while he ran a test on each evlinder. He found that Numbers 3 and 4 were about 10 pounds weaker than the rest That wasn't unusual especially on an old truck that had just had new rings installed. Some of them probably weren't fully seated yet. Even so, all the cvimders had enough compression so they shouldn't miss.

Gus made a routine check on coil, condenser, wiring and points.

Everything seemed okay. Mentally bidding his fishing trip goodbye, he chibed up under the wheel

#### Gua Suggesto a Ride

"Let's take a ride," he said. "We'll head her onto the steep hill just out of town. If she's going to miss, she'll do it there, even if she isn't under load."

"She'll miss, all right," Glen said grimly,

as he got in beside Enid.

The old International backed out of the garage and moved down the street, purring like a kitten.

They rolled across the flat, and Gus picked up speed for the hill ahead. As the

motor revved up it roughened and developed a distinct miss. Two cylinders, he told himself, as sure as you're born. He shifted, hit the top of the grade, slowed down and put her in neutral

"You drive, Glen," he said, "I'll ride the

fender a bit."

Gus lifted the hood, a neon-tube screwdriver in his hand. When they revved up for the next grade, he ran the screwdriver along the tops of the plugs. Every one of them flashed its gaudy red fire through the transparent handle. Yet cylinders 3 and 4 were

missing. Pull or no pull, he knew, now, this wasn't ignition trouble.

Gus got back inside the truck, "Let's take her back to the shop," he said

As they dropped onto level road, he turned to Glen again, "Now. throttle her down. As slow as she'll take it."

The truck idled perfeetly. Gus reached his foot across to put gentle pressure on the brake pedal. Not until the speedometer was wavering at the 10mile mark did the old motor begin to buck. No engine could perk along like that with bad valves, and compression had tested out well enough.

"When you did your overhauling job," he asked Clen, "did you

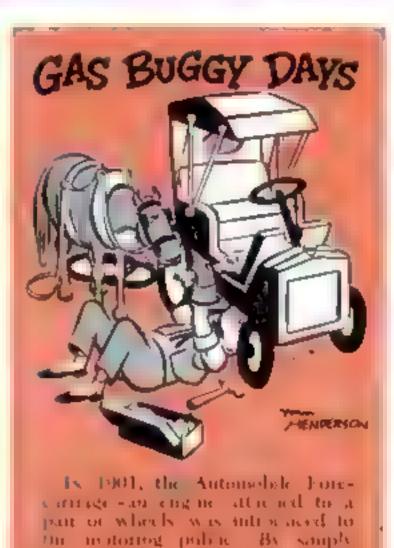

clean out the valve guides, and test the valve springs for strength?"

"Cleaned the valve guides with a wire brush." Glen nodded. "I didn't have the springs tested, but they seemed all right,"

"Let's see," Gus puzzled out loud. "You've had this trouble ever since you took the motor down?"

"It didn't miss at first, Mr. Wilson," Enid put in. "Remember, Glen, right after you got it done we drove up on-" She cut herself off and blushed.

Yeah, Gus thought. They went up on Lovers' Hill, where they could look out over the lake.

[Continued on page 218]

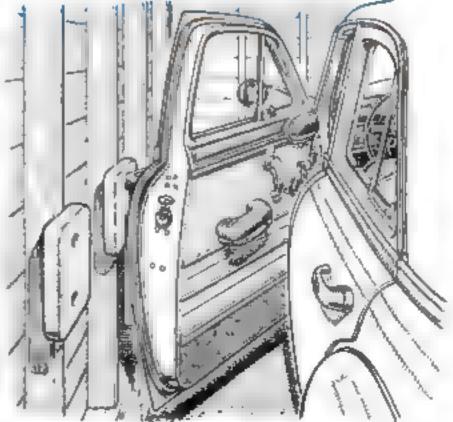

A trouble-light connection in the trunk is a handy addition to a car. If you have a light that plugs into the cigarette lighter, an additional lighter well, attached to a bracket under the trunk lid, will extend the range of its usefulness. You can connect

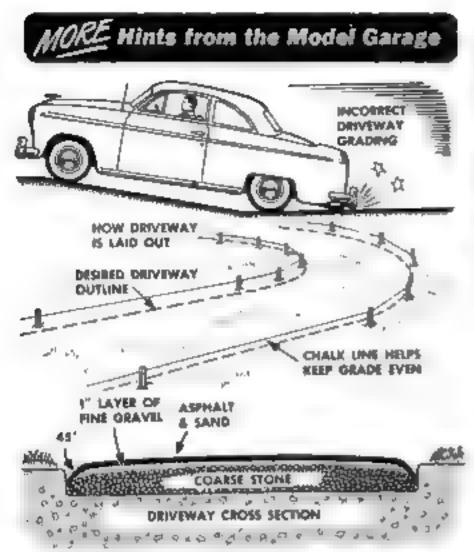

it to the license-plate wire. Miniature cable connectors available from radio-parts stores also offer a convenient means of hooking up a light. Two of these sketches suggest how to use them in connections in the trunk and behind the dash.

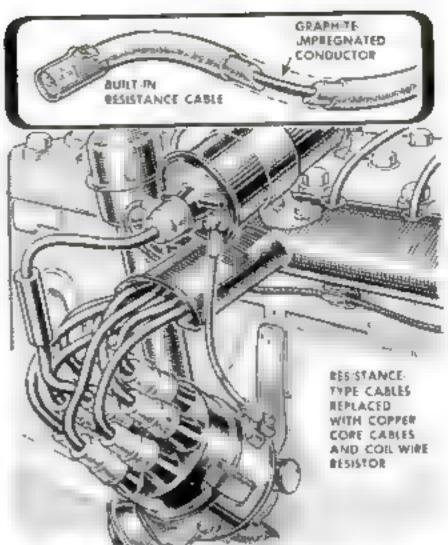

Leaving the doors half-latched when a car is in the garage is a good custom. This will give rubber weather stripping a chance to regain its resiliency.

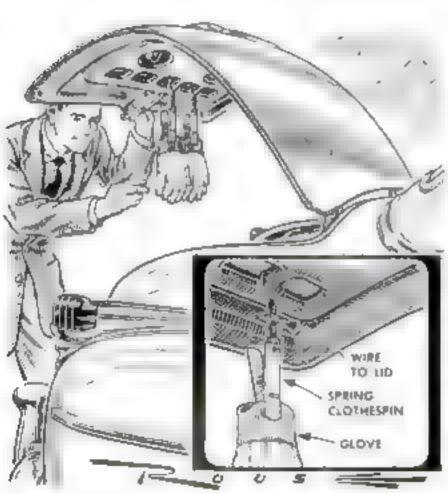

Wall bumpers made by nailing rubber kneeling pads to the wall will keep car doors from being scarred when they are opened in a garage where space is tight.

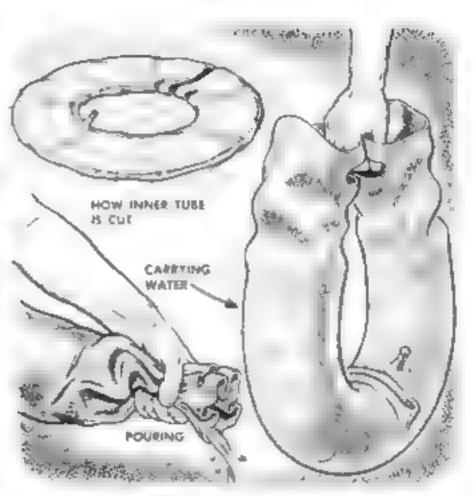

A sharp grade change, perhaps where a driveway joins the street, will cause bumpers and tailpipes to scrape the pavement. So if you are planning a new approach to a garage located above or below street level, lay it out to avoid abrupt grade variations. The sketch shows other helpful points for building a driveway.

When a tune-up fails to restore an engine's pep, have the ignition cables checked if they are the resistance type. New ones may be needed. Otherwise, you might try the trick of one reader who installed regular stranded cables, put a carbon-type suppressor in the coil wire and found the engine showed marked improvement.

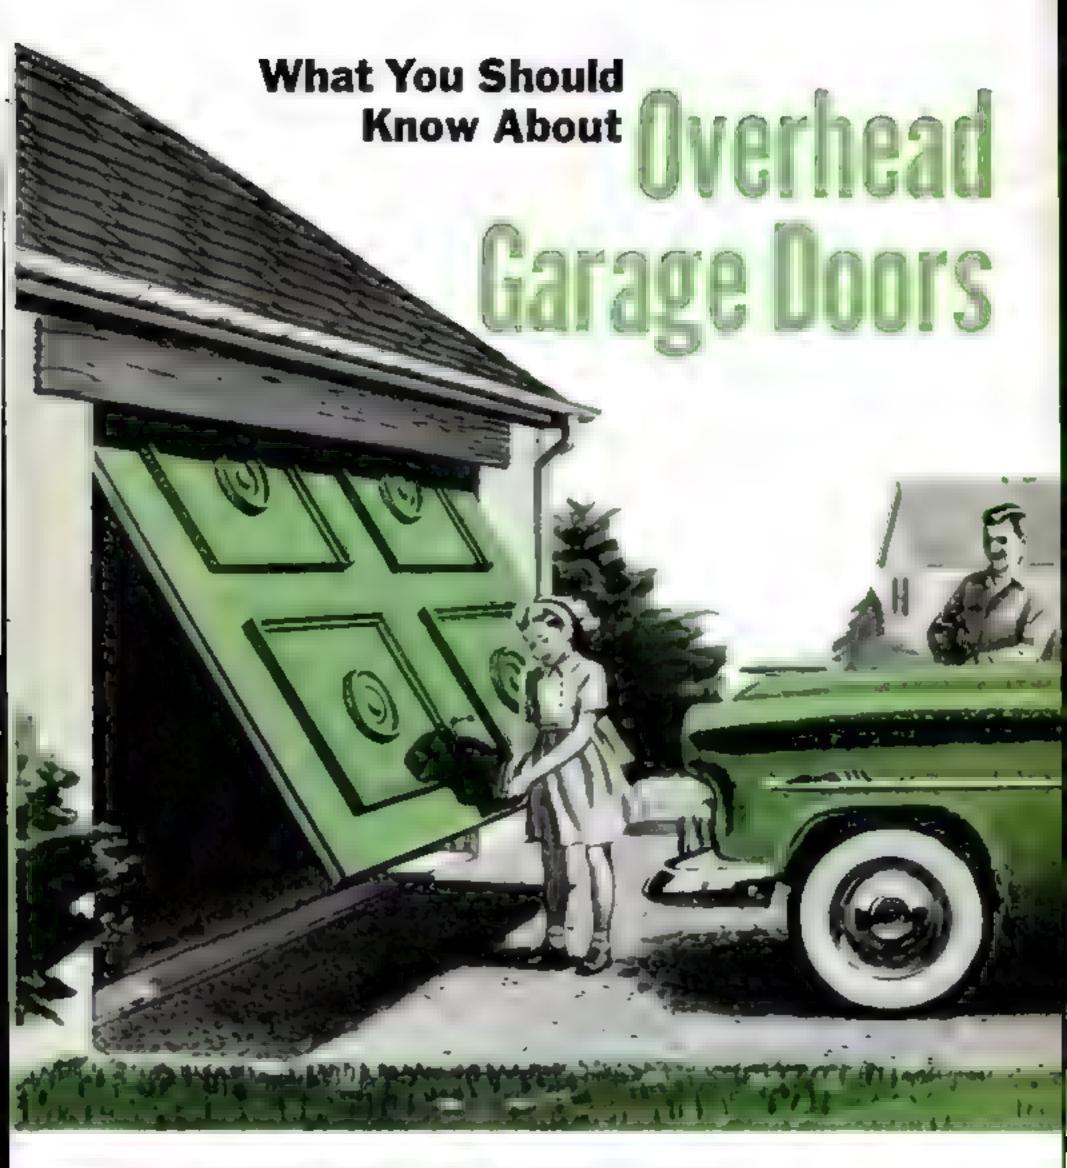

Work gloves for changing tires or other roadside jobs will always be easy to find if you suspend them in spring-chip clothespins wired to the trunk hd.

An inner tube cut like this and stowed away in the luggage compartment takes up little space—and will be ready for use if you need a container to carry water.

162 POPULAR SCIENCE

## If you would like the type that swings or rolls up, here's how to build and install your own at less cost.

GARAGE doors can be made to behave. Gone are the days of struggle with the sliding type, or banging your fenders on swinging doors that stubbornly refuse either to stay open or remain closed.

By putting in about a day's work, you

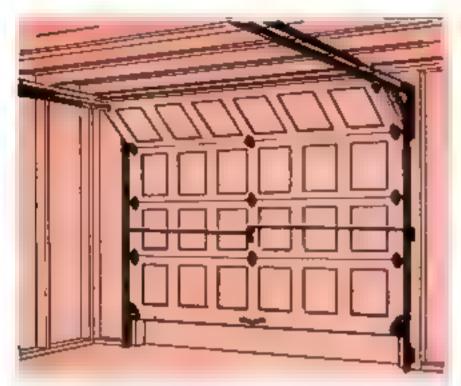

can equip your garage with a convenient modern door that swings up overhead out of the way almost at the touch of a finger. Here are ways to keep down the cost of such a door:

Buv hardware and lumber and build a

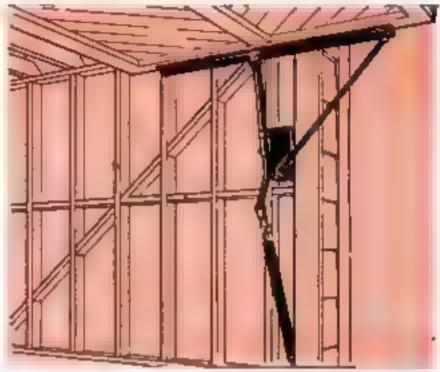

# Overhead Doors Work on These Types of Hardware

Overhead garage doors operate on three general types of hardware-jamb, pivot and track. Jamb and pivot types are usually least expen-

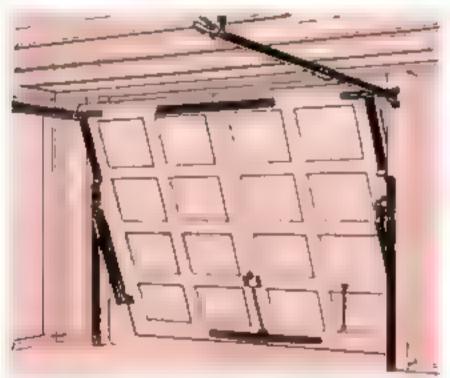

sive. In most cases, strong springs do the work when you operate an overhead door but one track type has a counterweight.

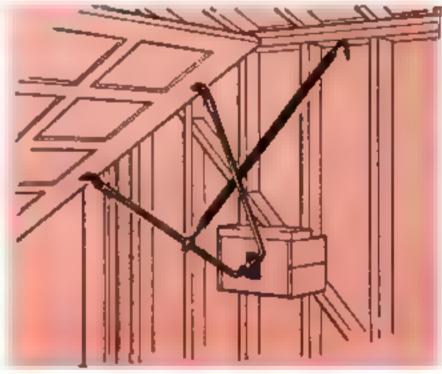

Track for Roll-Up Door

Jamb Type

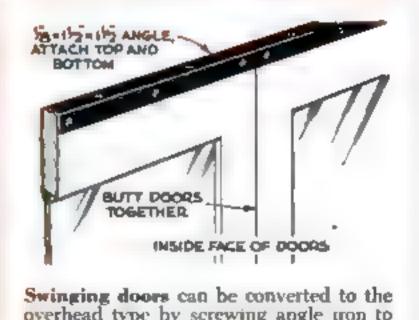

Track for Swing Door

Offset Pivot

Track with Counterbalance

Swinging doors can be converted to the overhead type by screwing angle from to the top and bottom edges to make them a single rigid unit.

164 POPULAR SCIENCE

new door, using one of several practical designs.

 Buy the hardware and convert an existing pair of swinging doors to a single overhead door.

 Buy an overhead-door kit, assemble the door and install it with hardware that comes with the kit

Any of these three procedures should save you money over ordering a ready-made door, either of wood or metal, and paying a carpenter to put it up. Converting swinging doors to overhead operation would, of course, be least expensive—the hardware would be your only cost.

Types of hardware. Three basic types of hardware are used to mount overhead doors and swing them up and down—jamb,

pivot and track.

Jamb hardware is attached to the inside edges of the two upright wood members (the jambs) that form the sides of the garage door opening. It works by leverage.

Pivot hardware is bolted to the side walls of the garage and works the door by swinging it up and down. This type is not easily installed when the garage itself

is much wider than the opening.

Jamb and pivot hardware is suitable only for one-piece, rigid doors that tilt or swing up and down. With the track type you can have either a rigid swing-up door or the sectional roll-up kind. Roller-bearing wheels moving on steel tracks make such doors easiest to operate. Unlike doors mounted with jamb or pivot hardware, these can be weather-stripped. Hence, track doors are most popular in cold regions. However, they cost more.

Hardware should be selected to suit the weight of the door. Most sets are safe only if the door weighs less than 150 pounds. If your door exceeds that figure, you should buy heavy-duty hardware.

Preparing the opening, if your garage is nearly new, the opening probably will be ready to take the new door. If you replace a hinged or sliding door with one using jamb or pivot hardware, the opening probably will have to be reworked.

Above all else, the opening must be squared up. Otherwise the door won't fit. If you are installing a ready-made door, it may be necessary to reduce the size of the opening. Two-by-sixes nailed to jambs and header usually will take care of this.

What style door? Besides being light in weight, perfectly square and well nailed,

# Kit of Materials Makes It Easy to Put Up a Door

HERE'S WHAT YOU GET when you order single-door kit from Cousart Enterprises, Los Angeles, Jamb-type hardware comes in one puckage, wood to build door in another.

2 AS FIRST STEP, the top two-by-three framing member is marked for length, \$4" clearance being deducted from jamb-to-jamb distance. Bottom member is marked same way.

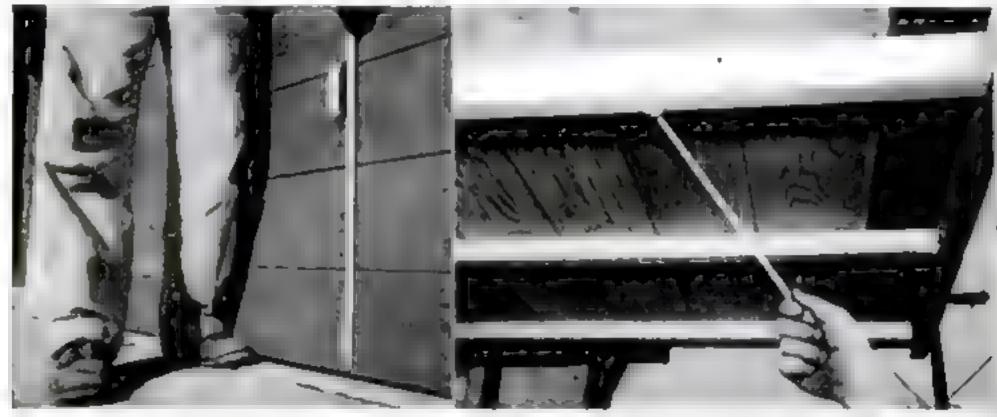

3 at ends, laid flat: a two-by-fours and a pair of two-by-twos. The material is for a door 7' wide and 8' high.

FRAME IS TRIED FOR SIZE after being nailed 4 together. Drive nails through top and bottom two-by-threes into ends of vertical pieres. Face flush side of frame outward.

5 TEMPORARY BRACE is tacked on (put it inside rather than outside as seen here) after frame has been squared by 34" wedge between header and top edge and jamb end.

HANDLE GOES IN MIDDLE of door 1614" 6 from the floor. This is best position for good leverage, and the handle will not hit the header when the door is swung up.

A PULL ROPE furnished with the kit is then knotted to an eyebolt and screwed into the middle two-by-three frame member so everyone can reach the door to pull it down.

the garage door you buy or build should be in keeping with the architecture of your home.

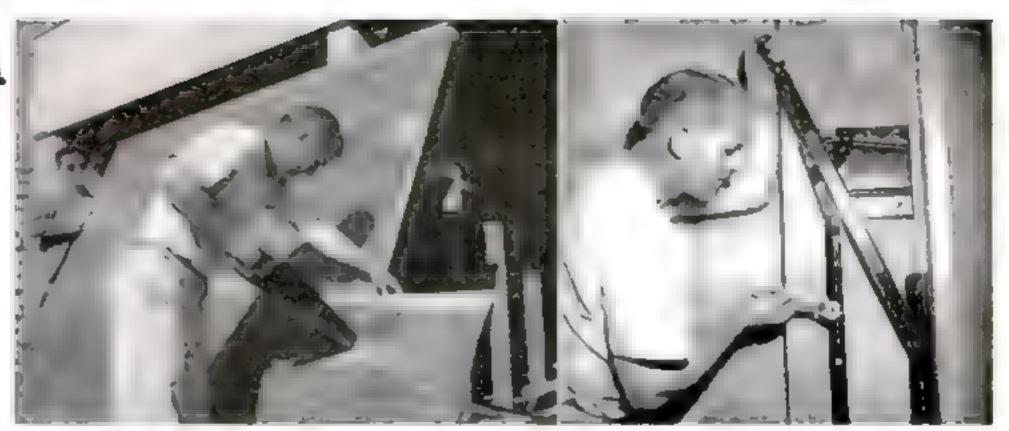

A plain board door will serve a strictly utilitarian function when facing an alley. Windows and shutters admit light and relieve the broad expanse of a double door facing the street. But however you decorate a door, be sure the design fits both your home and pocketbook.

Door maintenance. After your door is up and functioning smoothly, keep it that way by a regular program of maintenance. A door can do quite a bit of damage if it

should fall down on your car-or your head.

Keep all nuts tight and lubricate bearings at least once every four months. Inspect the clamps on pivot hardware and tighten them if necessary. The clamps sometimes slip up on the power arms—as you can see by the marks made on the power arm. Before tightening, pound the clamp down on the power arm to its original spot.

A truss cable usually keeps double garage doors straight while in the up position. If your door sags, the truss tapes need tightening. Before doing this, prop up the door with a two-by-four.

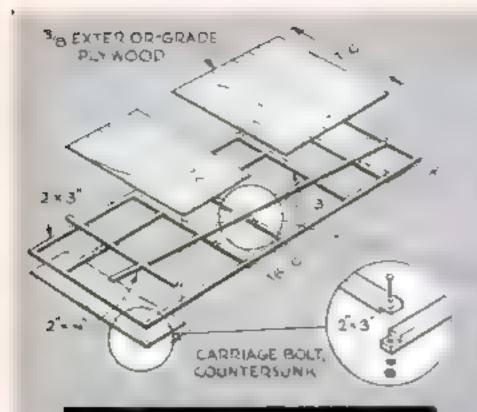

6 EXCESS LENGTH of redwood sheathing is cut off after all the pieces have been nailed on the frame. Each piece of sheathing must be drawn up onug against preceding one.

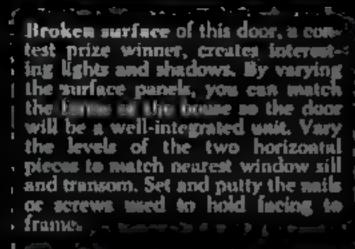

7 HARDWARE IS INSTALLED according to instructions that come with kit. Base of unit goes against inside of jumb. Door is shimmed into opening with \$8" stock until mounted.

10 FINISHED DOOR can be raised or lowered with just fingertip pressure if it is prop-

erly installed. The price of this kit is approximately \$14 FOB, Los Angeles.

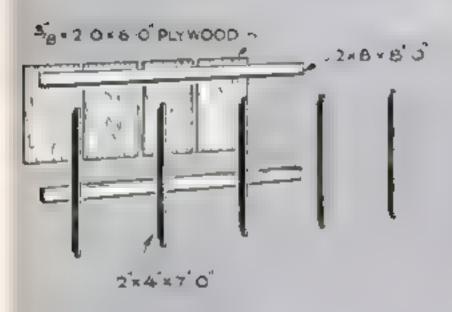

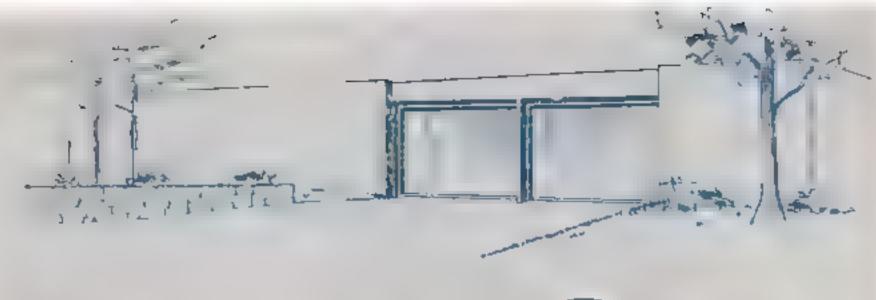

# **Prize-Winning Doors**

Him regarded one in a style te suit modern hones. Architects designed them as entires in a centest for doors the average longoving could bend Cosponsors of construct the Livaria

Framing erestes the design here. One or more of the plywood panels can be replaced with translucent material. Plywood can be left natural or painted, depending on effect desired by the homeowner.

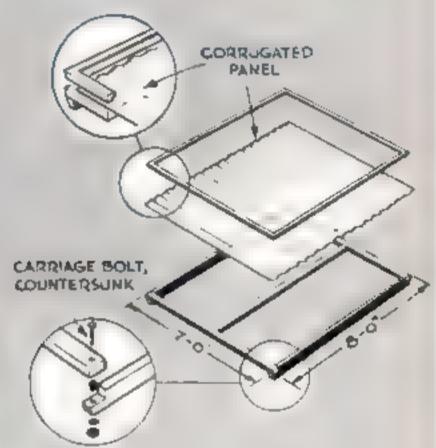

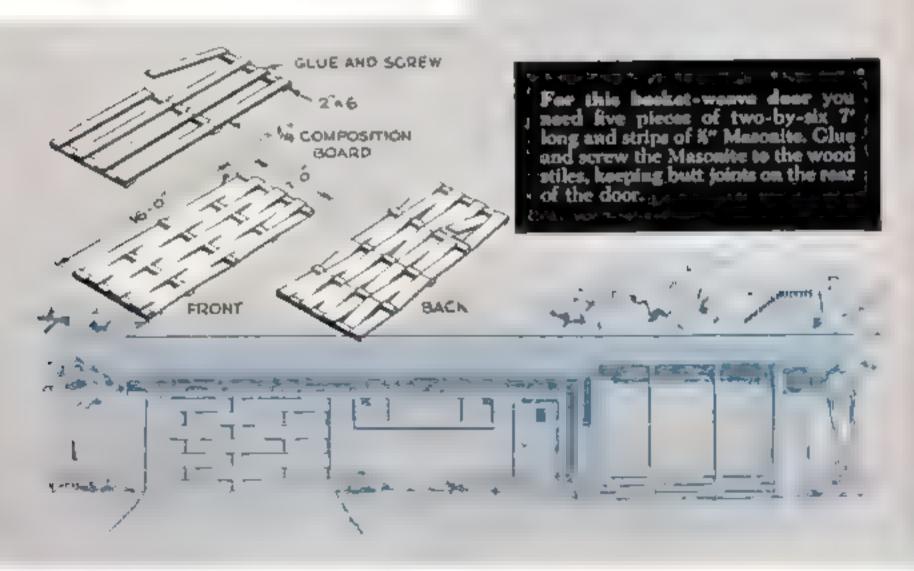

Translucent corregated panels of reinforcing Fiberglas and plestic are used as the closure material for this handsome door. Assemble the rear frame from two-by-forces, use two-by-twos to hold panels.

# That You Can Build

Co., Paramount, Calif. a manufacturer of overhead-door hardware, and the tricizine Arts & Architecture. The sketches were adapted from a booklet published by the hardware company

If you feel that your distributor falls down on the job, dual breaker points and a new plate may give it a shot in the arm.

## By E. F. Lindsley

MAYBE you're like me. Maybe your friends often find you with your hat under the hood of your gasoline charlot figuring ways and means of making the blankety thing pay you better returns. So maybe you've wondered whether dual points and a ball-bearing breaker plate are a sound investment.

They are. Last fall, I installed both units in the distributor of my Buick and performance has improved noticeably. You probably could get the same results. But whether you do depends partly on the kind of car you drive. Ford and Auto-Lite distributors are not adapted to the unit I used, Dyna-Flyte dual points and distributor-plate assembly,\* primarily because they either have dual points already or are not hadly troubled by breaker and rotation problems. Most other cars, sixes and eights,

could use the accessory dual points, a ball-bearing plate, or both the points and plate.

What are the benefits? If you answer yes to any or all of the following questions, the chances of a cure are better than good:

Has your engine ever stuttered its way through a high-speed missing session just when you were out to make time? Did it do this even though you had new plugs, properly gapped, and supposedly nourished by a hot spark through healthy lead wires and a good distributor cap?

Have you occasionally eased down from highway speeds to pass through a town and found the engine bucking so badly that it was miserable to drive under 30 without shifting into second?

Have you ever sensed something wrong with the idle when you stopped at a red light, yet when you stopped next time the idle was smooth as cream?

Does your car have acceleration "flat spots" where your pressure on the gas pedal

Renberles Products, 16108 Roselmen Ave., Destoit.

First step is to strip points and condenser from old breaker plate, remove the retaining screws, and lift out the plate. Then put in the new unit and attach the vacuum advance unit with new, slightly longer screws provided in kit.

tells you something should be happening but the speedometer lags lazily?

What's the cause? Such erratic engine performance as well as short-lived tune-ups all indicate a breaker-point system falling down on the job.

To understand why, think back to the lever usually identified as "spark" on cars of the Model T era. Nothing was automatic then about the advance and retard of the moment when fire jumped the spark-plug gap. You retarded the spark for starting, advanced her all she'd take while cutting along at top speed, and eased off while climbing a hill, until the knock was below frightening proportions.

Eventually, centrifugal advance systems were adopted. These have weights, like the flyballs on a steam-engine governor, to turn the breaker cam against rotation as the engine speeds up. This spark governor retards the timing to a reasonable point for starting and advances it as you pick up speed.

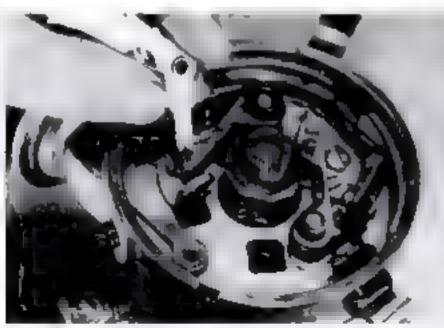

High-compression and high-performance demands, however, complicate the work a centrifugal control is expected to do, especially at high speeds. You get best fullthrottle, full-load performance with advance to a certain point. Any more would be inefficient and destructive. Yet at part-throttle cruising, considerably more spark advance would be an advantage.

Here's where a vacuum advance comes in. Operated by the varving vacuum in the intake manifold, it provides the additional advance in the middle speed ranges that the centrifugal mechanism cannot give

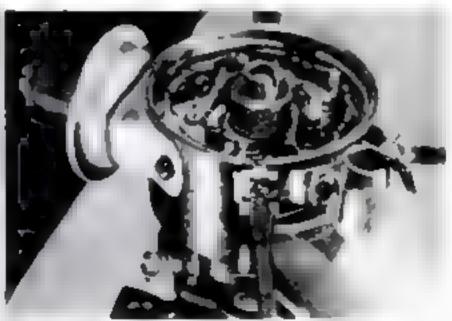

How encuum advance works. In most cars, the vacuum diaphragm moves a link arm back and forth to rotate a movable breaker plate. If the breaker plate rotates as it should, if the spring pulls it back to its designed location when vacuum is low, your engine will function smoothly

But here's the rub—and rub is the right word. Through wear, dirt, manufacturing variations and sheer perversity (or so it seems), the breaker plate does not always move as advertised. Consequently, the odd behavior which you sense in the driver's seat reflects the misbehavior of the vacuum advance system.

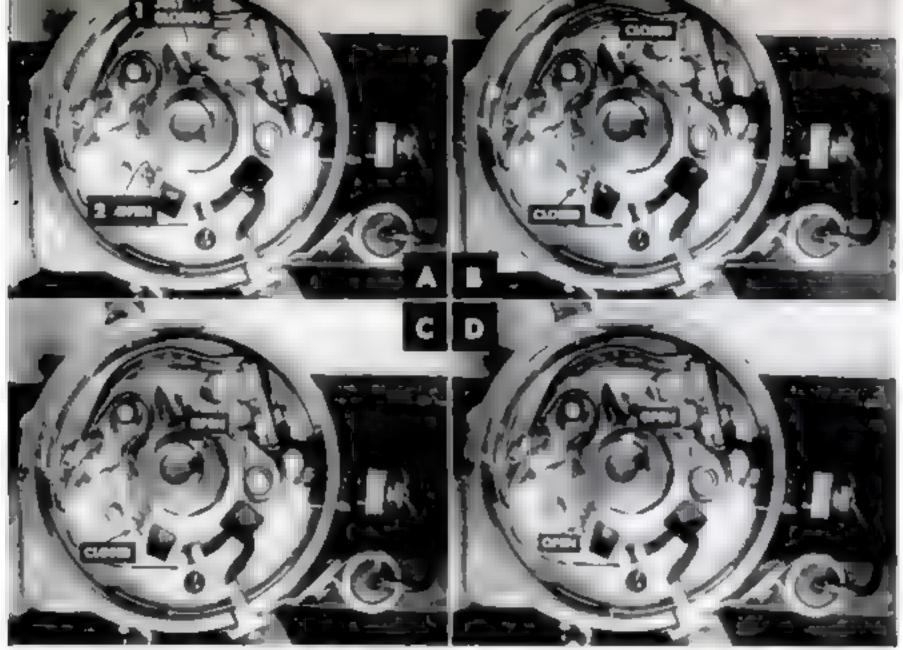

One of the original methods of mounting a breaker plate consisted of providing a groove inside the distributor housing to serve as a race for small steel balls supporting the plate. Unfortunately, wear in the groove and balls eventually limits movement

ACCURATE POINT CLEARANCE is vital. Feeler gauge of wire-type shown is okay with new points. If points are worn, dial indicator is

better. Condenser must go outside. Maker recommends condenser of higher capacity, but writer found original worked well.

HOW DUAL POINTS WORK. By lengthening the dwell angle, dual points give coil a longer period to build up a charge, thereby assuring a hotter spark. Here, in photo A, points at left (No. 2) are open and plug has just fixed, and points at right (No. 1) are just

closing. In photo B, the left points have also closed—and the dwell period begins. In photo C, points I have opened, but no spark occurs because points 2, which control the timing, are still closed. In photo D, the second points are open—and spark jumps the gap.

of the plate. About three years ago a sliding bearing replaced the ball race. This newer unit is longer lasting, but still leaves much to be desired in breaker movement.

It should be noted here that the type of distributor I am talking about can be recognized by the vacuum unit attached directly to the distributor housing. On types such as that found on the Chevrolet, the vacuum unit is mounted to one side of the distributor and just pulls and pushes the entire distributor around.

What's the cure? So much for the symptoms of breakeritis. The cure is a breaker plate so mounted that it moves with absolute freedom and just the proper amount of drag to match the calculated characteristics of the spring and vacuum diaphragm. The breaker plate that I installed is a precision device with a nicely machined bearing race and about a jillion small steel bearings to carry the load with beautiful smoothness.

One poke with your finger will convince you just how slick it is. Install one and drive the car, and you'll be even more convinced. If you are content with a single breaker

point, this ball-bearing plate can be used in the factory-installed distributors of a long list of cars.

If hy dual points? To appreciate the advantages of making this switch, you must consider just what a tremendous job we demand from a single set of points and an ignition coil at high speeds when the engine is turning up around 4,000 r.p.m. or more.

At this speed, each cylinder fires 2,000 times each minute. Multiply this by eight cylinders and you find that the coil is asked to charge and discharge 16,000 times each minute. Even at the speed of electrical energy, this isn't easy. To get a hot, intense spark, the coil needs a full charge of current long enough to saturate the primary. This build-up must take place during the fraction of a second the points are closed. Anything we can do to help along this charging of the coil improves high-speed ignition.

The period of time the points are closed is measured in degrees of cam rotation and is usually called dwell angle. Dual points increase the dwell angle, giving the coil a longer time to build up a charge. Second,

dual points reduce the amount of work each contact surface has to do. Thus, your points should last longer.

Installing the unit. Although dual points and the ball-bearing plates can be installed without removing the distributor, you'll find the job easier and get better results by clamping the works in a shop vise. Removal takes only a few minutes. If you are careful to watch exactly where the rotor on top of the cam is pointing as you lift out the distributor, there should be no difficulty in dropping it back and engaging the drive gear and oil-pump drive tang.

Complete cleanliness and secure connections, second nature with a good mechanic are the main things to watch for. Otherwise, the directions that come with the parts are

easy to follow.

Adjust the point clearances very carefully, drop the distributor back in its opening, and time the engine on the nose. If you don't have a timing light, you can get by with one of my trick solutions.

Timing tricks. For timing, I normally use an old tad-light bulb with a couple of lengths of doorbell wire soldered on. I chp one wire on the hot terminal of the battery, and the other I hook or wedge gently on the breaker point. With duals, you time on the

second point to open.

Then, with the engine turned so the timing mark is lined up with its pointer and the distributor rotor in position to point to No. I spark-plug wire when I clip the cap back on, I carefully turn the distributor body until the light just goes out as the points open. I then tighten the distributor hold-down screws and the job is done.

Another version of the same trick is to turn on the ignition, with the primary wire connected from the coil, and have someone watch the ammeter. The slight discharge through the coil will show on the ammeter. As the points separate, the needle will flick back to zero. Still another timing trick is to take the high-tension lead from the coil and, with the ignition on, hold it about X" from the engine block. As the points break, a spark will jump. If the timing marks are lined up, the engine is in very close time.

I have checked all these methods carefully with precision-timing equipment. If you are careful, they seldom will err by more than 1°.

Next Month: An expert will tell you about spark plugs. Even racing drivers sometimes install the wrong plugs the wrong way.

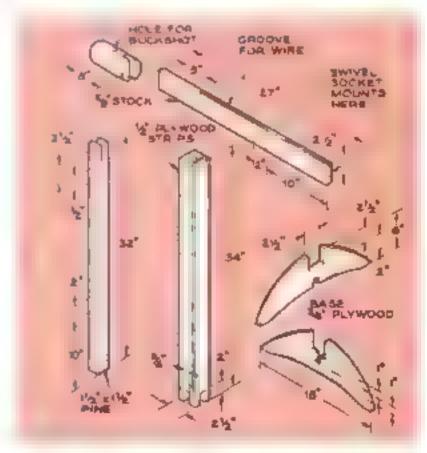

# Portable Spot for Shop

This portable light stand can be quickly swung into position wherever needed.

Scrap strips of plywood make the hollow column and a length of pine telescopes into it, permitting raising or lowering the light to the best height. A plywood arm, counterbalanced by a wood turning drilled out and filled with buckshot, supports the light. Both the arm and the telescoping shaft are drilled along their length. In the shaft, these holes are for a 37 dowel pin that holds it at the desired elevation. The holes in the arm permit extending it farther out from the stand.

Two types of bulbs are best suited to the light stand: the 150-watt reflector flood for general illumination of machines and the 150-watt spot for concentrating light on very exacting work.

# Retaining Walls

# ... Why, Where, How

A few rocks or logs can keep your lawn from washing, give you a level terrace on that sloping back yard.

## By Sheldon M. Gallager

YOU can make the good earth better. The way it comes naturally may not provide that level patio you've been wanting, a built-in driveway in just the right spot, or a lawn that doesn't wash away with every rain. For all these, you need a wall to hold back earth—either to make something you want or to keep something you have.

What kind of wall? Masonry walls—cast concrete or comented stones or blocks—are strongest but take the most work. They go best along a boundary, where a straight wall is needed, or to carry out the lines of a house, as for an adjoining terrace.

Uncemented walls-loose stones, logs, rock gardens-are cheaper, more informal

make picturesque, free-curving walls where precise construction is not needed.

Are footings needed? Not for uncemented walls—they give when the ground heaves, settle back again without barm. Masonry walls, however, will crack unless carried down well below the frost line—at least 2' in most localities. They should rest on a concrete footing at least 1' thick and 1' wider than the wall it supports.

Don't forget drainage. Loose walls drain themselves, but solid walls trap water that may freeze and heave. This should be allowed to drain by inserting pipes every 6' along the wall's base.

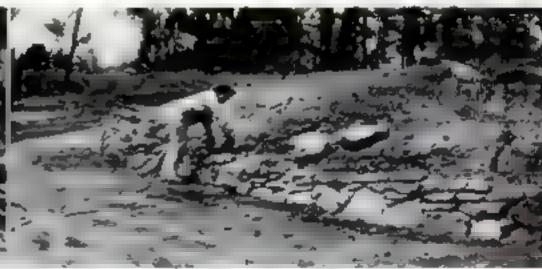

On this and the next five pages are a score of walls to fit every need—whether your problem is a mountain or a molehill.

I be a fact in a facility of the second of the second transfer to the second of the se

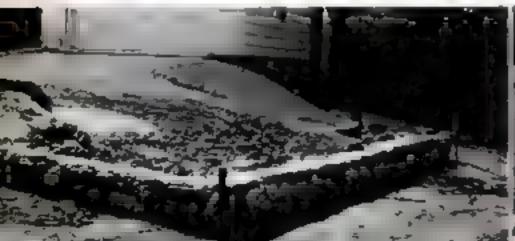

High foundation is screened by wall that makes house look lower, also provides level patto and small gurden on a problem grade.

Built-up grade converts unusable slope into level area. Lere for a driveway hirnaround. Wall is built first than backlesed with earth.

Bad erosion is stopped by piling loose stones ig unst bank. Here stones do not actually hold earth, simply keep it from washing.

Leveled lawn, made possible by edging of slate, is easy to mow, early wash into street. Slabs are set into ground below curb.

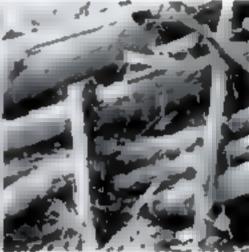

# Walls of wood are cheap and easy

Old railroad ties, usually free for the taking, give rustic look hold well because of their weight and last for years. They can be stepped to hold earth on a separation of strucked for struck wall on his

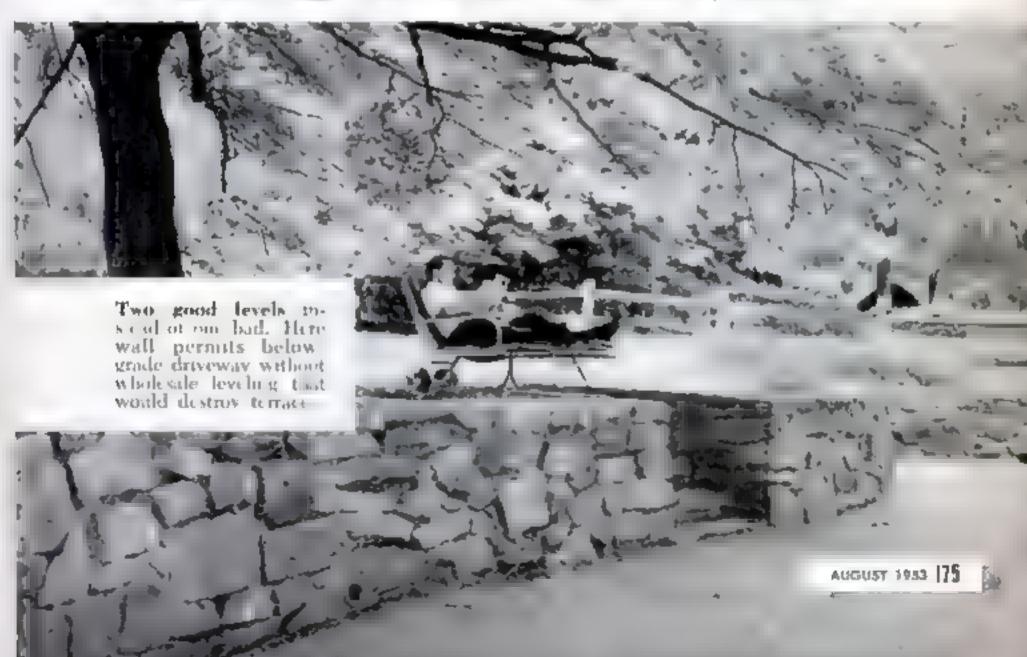

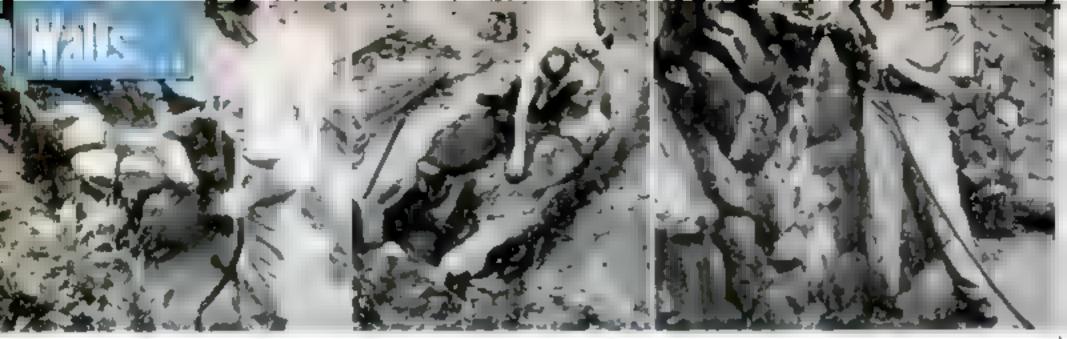

Logs had in rows (left) are easy way to keep by book from washing into street or driveway won't harm tires if accidentally bumped by ear Ponta 2 them whose adds trans appearance out lines driveway at eight. Where looks don't east ter, a batticide of logs coenter) will be dia

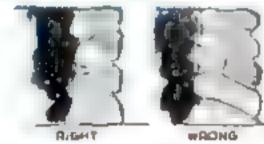

he pot dirt. Here several logs are driven into ground verticuly for support. Here others are stacked, crossiver be in the Attright coscie spaced wood stakes don't has length privace and wall to hold bank. Large posts driven down by lend fence help take stron.

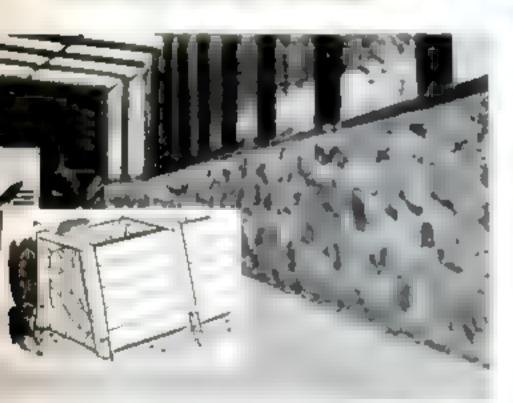

#### Trick with stones and cement makes wall that looks dry-set

Pocket of stones is set up and washed (left), then cement is poured in and more rocks plopped on top (center). When cement sets, next pocket is built up. 2' to 3' at a time, and process repeated. Final hosing (right) removes coment that pozes through to face, and result is wall that looks dry-set. Sketch shows how stones slant down at back to prevent heaving.

#### I wo easy ways to coment stone — Old bricks are rustic, cheap

Rough wall is a deay stuply para apstones. and south, central it were then We and gines work cereal tre cross he and ral A ragged riste of from it a

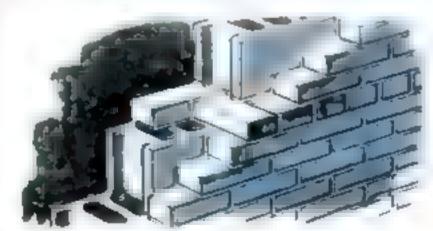

lextured wall can be made by building form 1. planks and two-by-fours and the plan in rocks and cement at rand to I raidin unites careful http://ot/steas asserts strent fit surface. Wall should be at heat 8 when it toy & as with at bottom as wall shiple

Used bricks, bought for penny apiece, make low edgings for house plantings or driveways. Turn bricks on end, embed half in ground,

Bricks stepped in roses will hold earth on a slope without requiring cement. Old mortar left on looks rustic, helps bricks grip ground.

Brick wall can be made by backing up facing with concrete blocks for strength. Run every fourth course of bricks back over blocks.

#### Loose stones need no cement

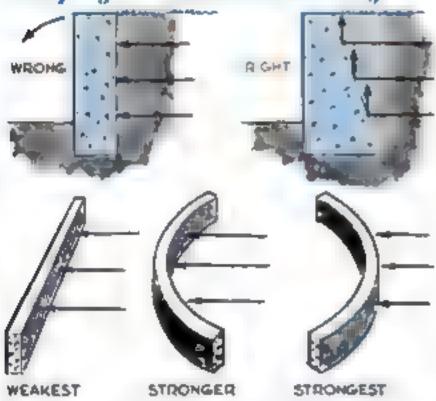

Loosely piled rocks will hold up to several feet of earth without cement. Choose square or angular stones instead of round ones that might roll, and stack in triangular sections (sketch). Later, earth can be packed into cracks and flowers grown to make a rock garden.

### Stepping your land saves work

Several small walls are easier to build than one big one, look better and eliminate danger of children falling. Sketch at left above shows how fill is saved by stepping. By both cutting and filling (sketch at right), you can use earth removed from high ground to build up low.

#### Shape your units for strength

Slope-backed wall (top right) deflects frostexpanded soil upward, is less likely to push out than straight wall that takes full brunt. At bottom, out-curving wall is stronger than straight, but in-curving one is strongest of all—arch effect keeps pressing joints tighter.

## I se a rock garden as a wall

Sloping walls, called breast-type, take least work of all, are often more picturesque where straight wall is not needed. Slope at top above is simply natural angle of soil, about 37°, held in place by plantings. By adding stones (bottom), slopes can be built up to 45° or 50°.

#### Fitted stones make informal walls, can't crack or heave

Dry-set walls, laid up without mortar, must be carefully fitted, but need neither footings nor drains since they let water escape and give when ground heaves. At left below, large ir-

regular-shaped meks are first set up, then cracks are chinked with small stones. Wall at right needs no chinks because flat slabs fit well, get strength from interlocking.

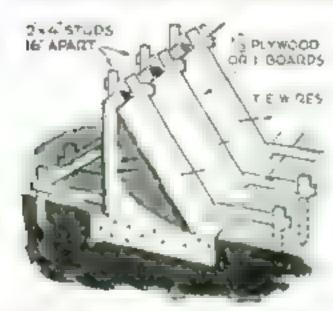

Photos courtery Partiand Coment Association

### Poured walls are strongest, can be made in three shapes

Form for poured wall is made with %" plywood, braced and staked. Pour footing first, let set, then fill form. Use one part cement, two sand, three gravel, enough water for workable mix,

Straight wall gets stability from broad, heavy base, like child's weighted toy that always lands upright. Width at bottom should equal 5 height. Inchned wall lies against earth, takes less concrete since base need be only & height. Cantilever wall is thinnest, takes least concrete, but needs reinforcing rods to tie it to footing that acts as counterweight.

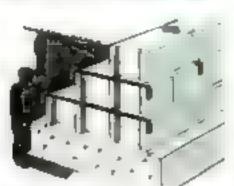

### Pitternapstale, anthermeterally be a conce

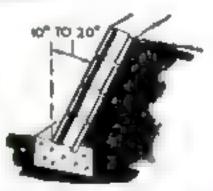

Old-fachioned buttress helps support tremendous load on this 12'-high wall, can be used in smaller versions to brace low walls.

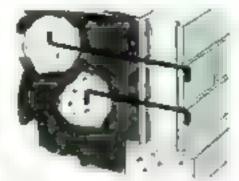

Reinforcing rods, embedded in joints, help tle blocks together so wall acts as single unit.

Stepped blocks give broad, heavy base like poured wall, but require no forms. Blocks should he joined by rods run-ning front to back.

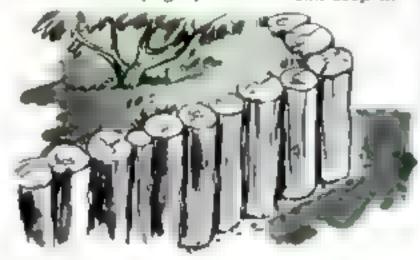

Inclined blocks are harder to push over. Set bottom row into footing while it's still soft.

Concrete anchors, made by pouring cement into pockets in earth, help hold wall-Blobs are tied to wall by rods bent at ends.

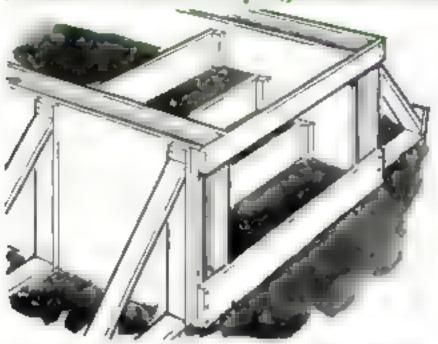

### Wells and boxes protect trees

Earth around trees must be kept at original level if you raise or lower grade line. Boxes can be made of wood stakes driven into ground (below), but should be big enough to encompass roots and tightly fitted to prevent loss of water. Wells should be made of loose, uncemented stones (right) so water can seep in.

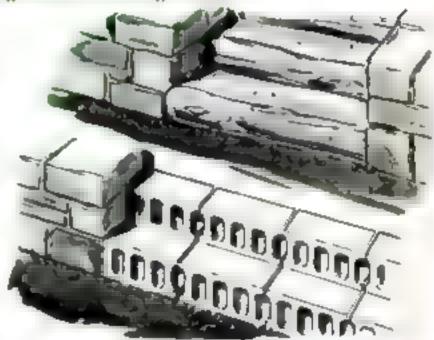

### Three kinds of steps you can easily add to any wall

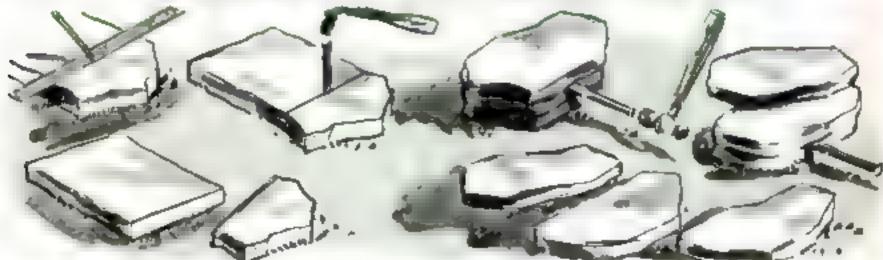

Poured-concrete steps are strongest, can be made by erecting two upright forms of plywood and joining these with cross boards for steps. Pour each step separately and allow to set so that weight won't push cement out bottom.

Log steps are easiest to make, look rustle, go best with wood or rough-stone walls. Concrete blocks turned on side are cheap, stay put well because of weight and provide natural drainage through mortar openings.

# You can shape your own rocks with a hammer and chisel

Stones can be trimmed to a straight edge with a haramer and cold chisel. Mark stone first with ruler and soft pencil on all sides, and score lines with chisel to depth of about 5" all around. Then use heavier blows, working chisel from center of stone out to sides, and rock should break cleanly.

Flat slabs for steps or walls can be made by splitting large bounders along seams where they have already started to crack. These seams usually look darker and deeper than others, often have moss growing in them. Work cold chisel along seam, using heavy hammer. Gradually deepen crack until rock splits.

# It's Not Cricket

But all photographers who hope to take good pictures should buy and carry

a dime-store cheeper. It is a sure way of attracting attention.

BEARS INVESTIGATING, ANYWAY. The cricket chirped in the back-yard darkness, and every eye of this fence-top trio focused on the source of the sound. Then came the flash.

17'S JUST A JOKE. Or so this happy guy seemed to think when the metal cricket chirped.

Witen you photograph pets or very young children, the sharp cheep of a toy cricket will attract and hold their attention

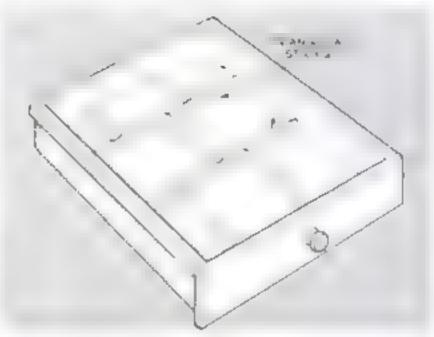

With pets, have everything in readiness for the exposure, click the cricket where you wish the eyes to be looking, and then trip the shutter. With children, the first use of the ericket usually will produce an expression of surprised curiosity. Later the child usually will eye the cricket with anticipation when you hold it forth, and break into a gleeful smile when you press it to squeeze out the cheeps.—Gilbert C. Close, Hawthorne, Calif.

# Thread Under Tape Zips It Off

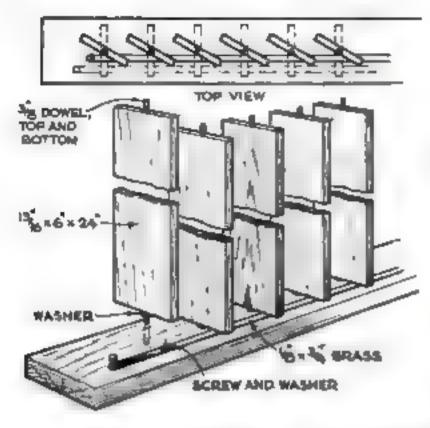

IT WILL be easier to open tape-sealed packages if you include a pull thread under the tape. For convenient application of thread and tape together, keep a spool of thread on a wire axle taped onto the dispenser.—Ken Murray, Colon, Mich.

# Parts Won't Stick in Drawer

Partitions for storing small parts neatly can be made with triangular wood strips nailed or screwed to a drawer bottom. The small parts slide easily up the sloping faces of the strips instead of catching in corners where they're hard to get out.

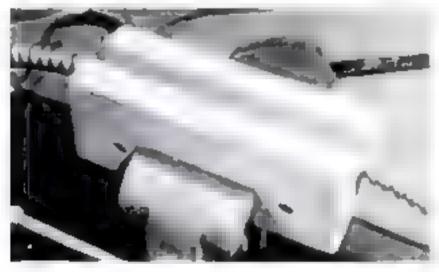

# Vertical Louvers Help Decorate Room and Ventilate It, Too

I BUILT these movable vertical louvers to serve as a backdrop for a wall planter and also help ventilate the room. Hardwood to match the wall paneling, the boards are 13/16" thick and each one is pivoted top and bottom on %" dowels.

A %"-by-%" brass strip with a link arrangement is fastened to one end of the louvers for opening and closing them.—
Hi Subley, Nuevo, Calif

### Miter Box Eases Cable Cutting

ARMORED electric cable can be cut a lot faster and easier with a miter box built of wood for the purpose. A spacer of slightly less thickness than the cable is needed between the side pieces. Nail the spacer to one side piece. Fasten the other side to the spacer with roundhead screws in countersunk, oversize holes so it can move about %". Clamp the box closed and carefully make a 45° saw cut through the sides. In use, the cable is placed in the box and the box clamped in a vise. A hacksaw will then cut the cable at the correct angle.—Will Thomas, Buffalo.

## Sticks Measure Height Quickly

MEASURING long vertical distances is often difficult with a folding rule of flexible tape. Two strips of wood, slid apart to fit in the space and clamped, will do the trick. The clamped strips can then be removed and laid flat for easy measuring.

# Foil Catches Paint Drips

A PIECE of aluminum foil held around a paint can by a rubber band will catch drips running down the side, making the can easy to carry from place to place. Fold foil upward against can for re-use.

HINGED SUPPORT to swing jointer out of the way is shown at left. Jointer ready for op-

eration, with power supply from belt on speed changer, is demonstrated at right.

NEW accessories to give the Shopsmith, multipurpose home-workshop tool, more versatility will be placed on the market next month.

Most important of the lot is a jointer, hinged on the support for the left end of the rails that hold the head and motor. Down out of the way when the spindle is being used, it can be swung up easily and locked for use

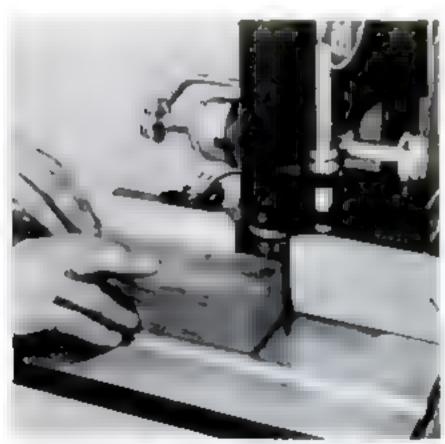

Heretofore, installing the Shopsmith joint-

er attachment—on the spindle side—was a 15-mmute operation.

MELO

A second accessory is a shaper fence with a screw adjustment on the infeed side with a knob that clicks every 1/64" of depth in cut adjustment. A third is a universal hold-down with a wide variety of uses.

Magna Engineering Corp., the manufacturer, this fall will begin corrosion-proofing the Shopsmith to prevent rust in damp atmospheres.

SHAPER-FENCE SPRING INDICATOR for depth of cut is located just under quill feed gauge. Fence locks front and rear on Shopsmith table with cast, U-shaped clamps.

function on miter gauge, rip fence or shaper fence, or can be clamped to any side of table with Shopsmith vertical or horizontal,

### It's Easy to Embed Decorations in Plastic to Make Novelties

Handsome plastic novelties are easily made by embedding shaped wire or thin metal objects in a sandwich of clear plastic. Use acrylic (Plexiglas, Lucite) half as thick as the finished piece is to be. Place the wire on one piece, cover it with clear cement or a solvent such as chloroform (caution, it's

inflammable!) and clamp overnight with the second plastic piece. If decorative object is thick, you may have to soften the plastic by heating it in an oven. After job has hardened, trim plastic to size, polish the edges and drill any holes that are needed. —Walter E. Burton, Akron.

#### Kit Builds Power Mower

You can build this power mower from a kit, add your own secondhand motor, and have a complete rig for about \$60. The kit alone costs \$46.95, contains all parts, has an 18" blade and can be powered by any 1%- to 2%-hp. gasoline engine. The simple belt drive makes it easy to adapt different sizes and types of motors. Another model, for use with any %-hp. electric motor, has a 16" blade and costs about \$25. Both models, made by Sensation Mower, Inc., 7577 Burlington St., Ralston, Nebr., have rubber tires and blade-height adjustments.

### Vacuum Cleaner Blows Up Pool

You won't waste breath puffing up the kids' plastic pool if you make your wife's tank vacuum do the job. Whittle a hole through a sponge-rubber ball, connect the hole to the pool valve with rubber tubing and stuff the ball in the exhaust end of the cleaner.—Joel H. Zinsmeister, Hamilton, Ohio.

### **Drill Stire Old Paint Fast**

Time quick-and-easy way to stir old cans of paint is with your drill press. An efficient sturring attachment can be made in minutes from thin tubing, one end of which is made into a propeller by hack-sawing slots and bending the tabs.

For small cans 7" is a good shank length; for gallons, about 10".—Harry L. Truchelut, Atlanta.

# These words and pictures will help lick the problem of picking the right roof-rig for your location.

# Choosing the Right TV Antenna

IF YOU plan to replace that rickety stork's nest on the chimney with a slick new signal catcher, this chart's for you. It will steer you through the bewildering array of arrays that can be bought, and gives hints on choosing the right rig for your location. Here are some tips on using it

Db gain. This is electronic lingo for the amount of energy that an antenna will pick up. If you're not an engineer, just remember that roughly speaking the higher the db-gain number the better the antenna.

Band width. This concerns the number of channels an antenna can pick up effectively. In a theoretically perfect antenna, all channels would be received equally well, in practice you lessen the gain from other channels when you design for the most gain from one. An all-channel or broad-band antenna, then, will be a compromise, giving a bit less than the best on each channel

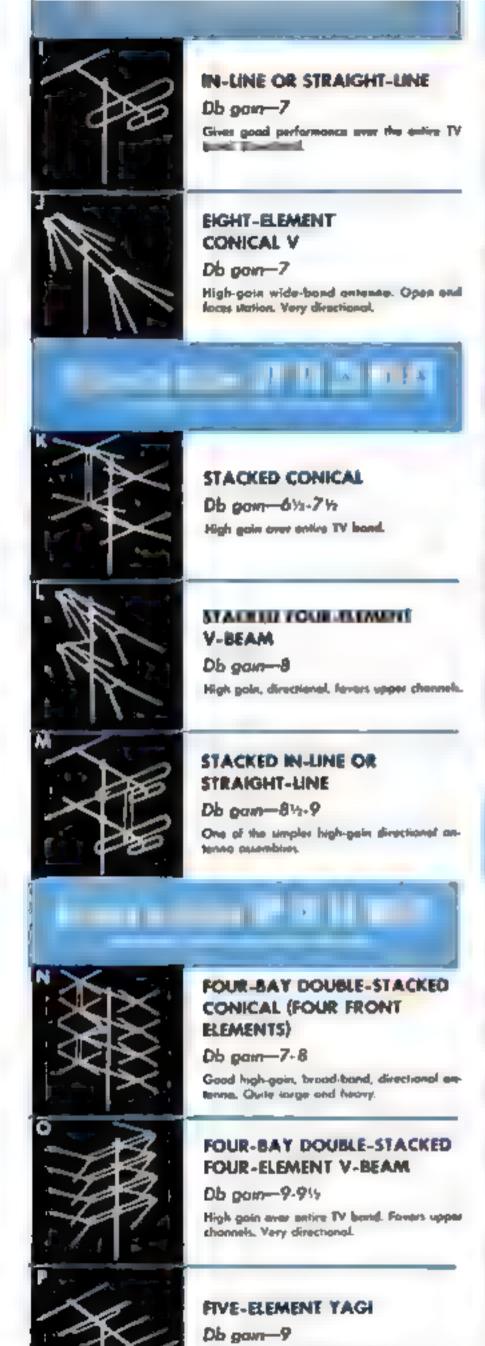

Directivity. All antennas are directional to some extent, but some are far more so than others. A highly directional job is sometimes valuable in eliminating interference or "ghosts," but unless all the stations you want are in the same direction, you should be able to rotate it.

Distances. The classification of antenna types by distance to transmitter should not be interpreted rigidly. The figures are average for satisfactory reception. In favored locations you'll be able to use a less elaborate antenna, and in difficult spots you may need a fancier array.—Rudolf F. Graf, NYC.

WILLIAM TO THE **BUILT INTO** Db gam—0 THE RECEIVER Usable only where signal is very strong, INDOOR Db gam-0-2 Usually better them A but still useful only class WINDOW Db gam-3 Maderate gain on all channels. High-frequency slubs help on upper channels. STRAIGHT DIPOLE Db pam-0 Simplest autidioar antenna far strong-signal DELAIGHT DIFOLE WITH REFLECTOR Db gan-5 Addition of reflector increases gain but makes patenna directional. **FOLDED DIPOLE** WITH REFLECTOR Db gain—5 Good broad-band patenna. For best results. use one for channels 2 to 6, another for 7 to L3. Directional. CONICAL Db gam—5 All-channel antenna. Moderately directional. V-BEAM Db gain 61/2 Brand-board directional antenna with better gole on upper channels. Open und foces toword station.

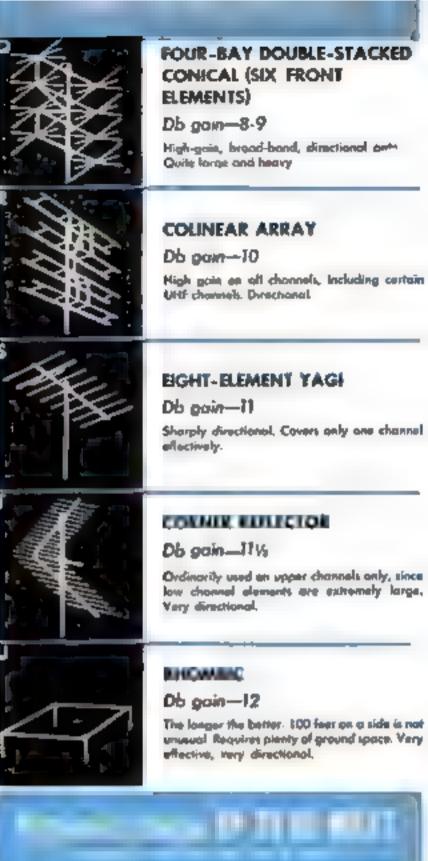

Distance to Station UP TO 10 MILES

184 POPULAR SCIENCE

Very directional. Each antenna good for eaty

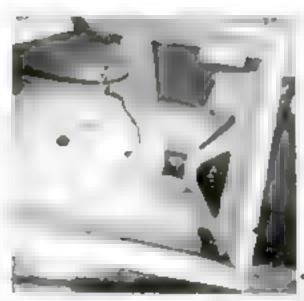

one channel.

OVER 85 MILES you'lt need a bit of luck and some cooperative cloud formations to bounce the signal back to earth and you'r antenna.

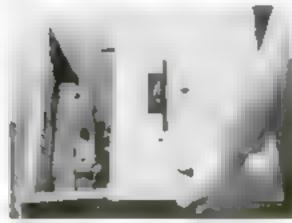

# Chairside Cabinet Now Hides My Radio

**SPEAKER** is acrewed over hole cut in cabinet end. Loop antenna was tacked on side.

ATTACH CHASSIS to 4" plywood for easier mounting. Then screw it to box.

PLYWOOD PANEL is covered with artificial leather, too, it rests on blocks on sides.

You don't have to be an expert to shift an old set from an outmoded box to a smart, modern cabinet.

TRIM and up-to-date in appearance, my homemade radio cabinet serves as an end table, too. A hinged lid keeps out dust, opens for tuning Artificial leather glued on the plywood top and sides hides my slips with saw and hammer.

Housing the works from an outmoded set in a chairside model like this is a worthwhile project for anyone. It gives you a handsome piece of furniture in place of a monstrosity. And locating the radio beside a chair saves many steps.

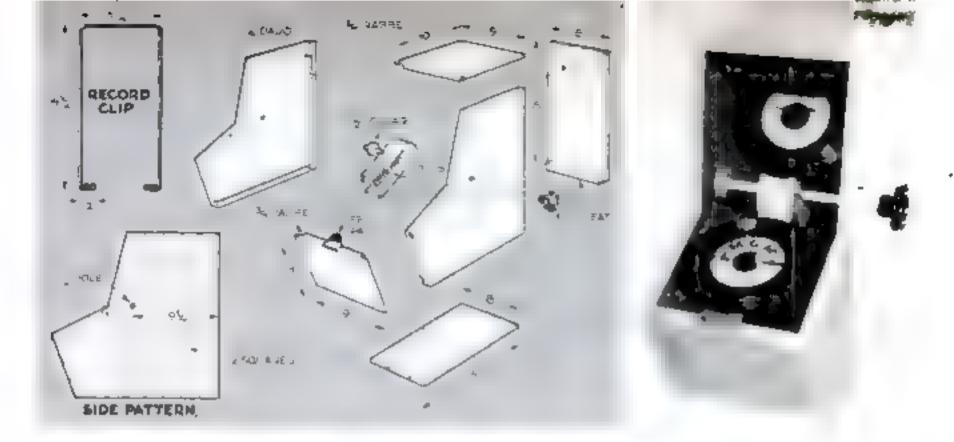

My cabinet consists of six pieces of \$" plywood, However, thinner and less expensive material might be used. The two sides are 19" by 27", the ends 14" by 19", and the top and bottom 14" by 27". The panel was made from 5" plywood.

An opening was cut in one endpiece for the speaker. I shaped the opening as an H, my initial. You may want to do something of this sort, or perhaps cut a circle and glue 4" dowels across it. After the opening had been covered inside with cloth, I attached the speaker with screws.

To form the lid, I sawed a 7"-by-18" section from one corner of the top and attached it with a strip of piano hinge. A coping saw was used to cut holes in the %" plywood panel for the knobs and dial.

Ends and sides of the cabinet were nailed and glued. When the radio had been mounted, I attached the cabinet bottom with screws. Funshing nails hold the top. Driven in with a nailset, the heads of these disappeared in the leather.

—Darrell Huff, Sonoma, Cali

# Records Flip Over in This Cabinet for Easy Selection

SLOWLY twisting the knob on the side of this cabinet brings both sides of 45-r.p.m. records into view. About 25 of these records can be stored in the cabinet. The records flop over like pages of a book, coming to rest on the felt pad, then dropping down into the cabinet as the next record swings out from above.

The 4"-diameter hub is cut from a piece

of two-by-four A radio or rheostat knob turns the "" dowel on which the hub revolves. Two "" collars keep the dowel centered in the cabinet. The clips are formed from wire clothes hangers.

The cabinet parts are all cut from X" plywood except the back and bottom, which are X" thick and fit into dadoes cut in the sides.

—Larry E. Fannon, Los Angeles.

### Hi-Fi System Has Two Speakers

Two matched 10" speakers providing wide-range distribution of music and sound are featured in a new portable high-fidelity sound system called the Rhythmaster.

A variable-speed turntable plays records from 6" to 16" at normal speeds of 33%, 45 and 78 r.p.m., as well as any variation of speed from 25 to 100 r.p.m. without distortion. Rek-O-Kut Co., 38-01 Queens Blvd., Long Island City, N. Y.

## Connectors Made with Kit Parts

THE electronic experimenter, model railroader or radio builder can assemble multiple connectors with any number of contacts using combinations of four basic

parts contained in this kit. Called Vancons, the contacts can be put together in a variety of arrangements to polarize the connections. Side brackets hold the parts together after assembly. Elco Corp., 190 W. Glenwood Acc., Philadelphia.

# You Run This Tractor

Midget battery-powered "cat" works on special frequency requiring no ham license.

### By Howard G. McEntee

JUST start up this midget caterpillar tractor and you'll stop everything else in the neighborhood. Kids will quit baseball and fathers will drop their lawn mowers to watch it go.

From anywhere within 100 feet, you drive it—by radio—as if you were behind the wheel. Steer it around obstacles, stop it, reverse it, slew it around on a dime or park it in its own length. Responsive as a sports car, it's as powerful for its size as the real thing. What it can't dodge it will often climb in true "cat" fashion.

Radio control made easy, Been wanting to get started in radio control? Here's your chance. Operating on a special 27%-megacycle spot set aside for this use, you needn't know code or take an operator's exam. As for radio know-how, most of it is packaged in the transmitter and receiver kits you buy.

These two kits cost about \$34, tubes and batteries extra,\* but they offer the advantages of simple assembly and clear instructions. Your transmitting license is obtained by mailing a form enclosed with them.

Less vulnerable than a plane or boat, the tractor is an ideal model with which to try your radio-control wings. It won't crash, run away or get lost if you fumble or the system fails. Besides, you can run it indoors.

Toy tractor converted. A husky sandbox toy 12" long provided a realistic body, wheels and tracks for the model

For electric drive, the front wheels spin freely on pieces of brass tubing mounted on a fixed steel shaft. Other pieces of tubing space the shaft in the frame, and it is retained with nuts at both ends. The body and frame holes it passes through were enlarged to K"-long slots, which make it possible to adjust track tension.

Each rear wheel is soldered to a live axle made of K" tubing. Both axles turn in steel

\*Berkeley Model Supply, West Bempstead, H. T.

# by Radio

bearings soldered to the body and track frames, and are aligned by a fixed shaft through them. Gears soldered to the axles drive them from separate motors, geared down about 800 to 1.

An HO-gauge locomotive worm and gear give a reduction of 29 to 1, the next two gears about 4% to 1, and the final pair more than 6 to 1. Any similar combination of gears can be used.

Each worm gear and its intermediate gear are soldered together on a bushing and spin on a stud. The middle pair are similarly mounted. All stud holes are oversize so that gear mesh can be adjusted.

Track rollers added. Five plastic rollers mounted in each track frame project 3/16" below it. To drive the tracks more positively, a rubber tire was fitted to each rear wheel. The mounting rim consists of a 2%"-diameter wood disk with a %" center hole, sawed across the diameter, sanded to a snug fit inside the wheel, and cemented in place. The wheel was spun on an arbor and the groove turned. The rubber-tubing tire, cemented into the groove, is scored to grip the tracks better

Wipe excess lubricant off the tracks before installing them. Adjust the front wheels so that the top of each track can be lifted \$" with light pressure.

Choosing the motors. These are permanent-magnet battery motors with bronze bushings and heavy-duty brushes. Pick two that rev up to about the same speed as indicated by pitch; if one tread runs ahead of the other, you may have to put an adjustable resistor in its circuit.

My motor shafts proved a bit too big for the worms. By running the motors on three volts and holding a fine file on the shafts, I dressed them down enough to fit. A light tap seated the worms for keeps.

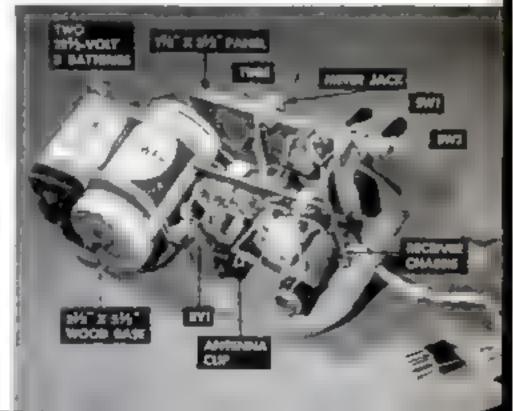

How the controls scork. A cat is steered by slowing one track and letting the other run, so your radio control must allow you to run either motor without the other. It's also nice to be able to start, stop and reverse both motors simultaneously. But all the transmitter can do is send a signal or not. How to wangle all these choices out

pressed-steel toy. To remove tracks, pull pin from one link as shown. A 14" piano-wire antenna is set into a plastic rod, threaded for a nut that jams it in the exhaust-stack hole.

RECEIVER KIT (above) includes parts, chassis and receiver relay, as well as instructions. Assembled as below, with flashlight A and hearing-aid B batteries, receiver goes under engine hood of tractor. The base and switch panel are cigar-box wood. Three-pronged plug connects to control unit.

ELECTRIC DRIVE under chassis should be protected if tractor is run in sand or grass. Axle holes in inside track frames are slotted upward for easy assembly. Brace from each axle bearing is soldered to body. Worm gear and second gear are soldered together as in drawing. So are third and fourth (intermediate) gears. Paired grass spin on studs.

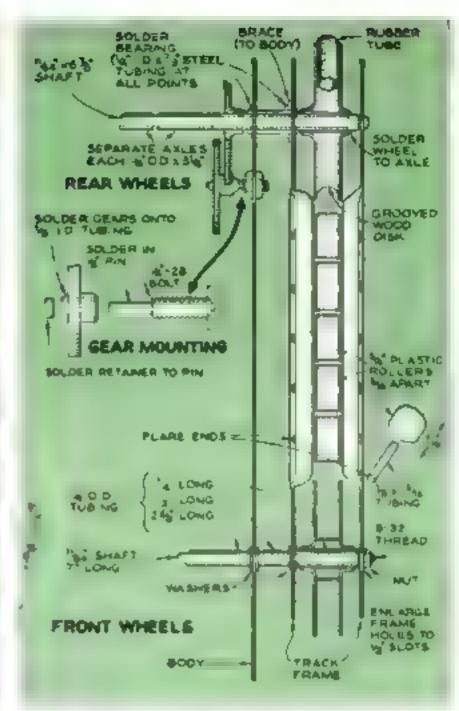

of simply this straightforward yes or no?

Let's look at the receiver. Current from two tony B batteries normally flows through the tube and the receiver relay. The magnetized core attracts a spring-tensioned armature to a contact point. But when a signal is received, it blocks the tube; little current flows, and the spring pulls the relay armature back against another contact point.

Through the relay points, a comparatively heavy current can thus be switched to two circuits, one if a signal is being sent, the other if no signal is sent.

Pulsing gives control. Instead of a steady signal, the transmitter sends an on-off pulse 200 times a minute. This makes the receiver relay flip from one contact to the other, sending current to first one and then the other of two low-voltage relays.

Each of these closes the circuit to one motor. But the relays do not open between

pulses. A husky condenser across each one (C1 and C2) stores enough energy to hold it closed between pulses. Both motor relays stay closed and the tractor runs straight.

If you throw a steering switch on the transmitter one way, it sends a steady signal instead of a pulse. The receiver relay stays open, holding one motor relay closed and the other open. The tractor turns right.

Throw the steering switch the other way, and there is no signal at all. The receiver relay stays closed, sending juice to the other motor relay, and the cat turns left.

Stopping and backing. For these controls I added a rotary sequence relay out of an old electric train. The coal was rewound to work on the 4%-volt tractor battery, and connected to the points of an 8,000-ohm relay. The relay coil is coupled by a tmy transformer and rectifier to the motor-relay circuit.

An extra switch in the transmitter pulsing circuit, when pressed, increases the pulse frequency. The motor relays remain closed, but this higher frequency boosts power in the transformer circuit, so that its relay closes, actuating the sequence switch.

Motor current also passes through the

transformer-coupled relay, which cuts the motors as the reversing relay is energized, saving juice and motor strain.

Just a touch of the transmitter button throws the reversing switch to the next step, the sequence being forward, stop, reverse, stop, as in the electric locomotive.

The power supply. A flashlight-cell A battery and two hearing-aid B batteries work the receiver. For the motors and relays, you might use six or more D-size flashlight cells in series-parallel, but a midget storage battery is a neater solution. Although high in first cost, it runs the tractor 2% hours and can be recharged many times.

Building the units. I made the receiver and control units on separate bases with plug connectors for easy removal and servicing. Follow kit instructions to assemble the receiver. Mount it upright on a wooden base with small angle brackets. The two relay-point leads and one battery lead terminate in a three-pronged plug. The whole works slide under the tractor hood.

Setting the relays. Before they are installed, armature-spring tension must be reduced by removing the screw at the rear of each motor-relay frame and bending the spring inward. Tension should just suffice to snap the armature to the upper contact reliably when the coil is not energized. The upper contact should be bent to leave a gap of .006" when the relay is powered.

RY5 must operate on very little current. With the armature brought within .010" of

control system, on aluminum chassis, is held in tractor by three screws, two of them run into wooden receiver base. Motor relays, transformer and rectifier are mounted on thin bakelite fabric held upright by a tiny bracket. Eyeletted holes around panel make handy wiring tie points. Transformer is held on by light metal band. Space the reversing relay as far from RYS as possible to minimize magnetic interference.

CK705

TRANSMITTER AND PULSER are housed in a trim case. SW3 is a normally closed switch, which opens when you push the button. The pulsing relay is one like RY5, and must be insulated from the chassis by mounting it on a bit of plustic. Replace on-off switch provided with a double-pole type that will cut the B supply as well as the A battery.

TONE RECEIVER as instructed in the kit, using a low-range milliammeter. Meter jack in B-plus lead is convenient, as the tube changes characteristics with age and plate current must be adjusted by resetting the plate resistor from time to time.

the magnet, turn the outer contact in to leave a gap of only .0025". Armature tension must be adjusted with the rig working.

The transmitter. Assemble this according to instructions but substitute a double-pole switch for the one provided, and do not hook up the "key" switch at all. The pulsing circuit is mounted on a small aluminum chassis attached to the cover of the case, where it fits into the space ordinarily occupied by a second B battery. For the tractor, one 67%-volt battery gives enough operating range.

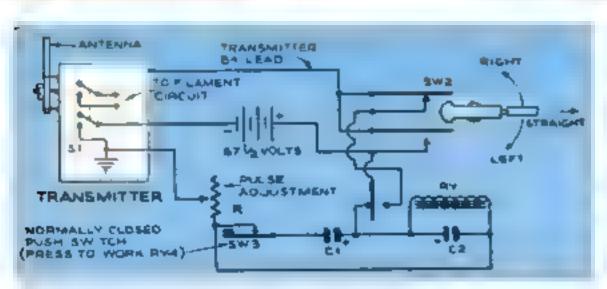

The steering switch SW2 must be hooked up to close the open circuit for right turn, and to open the closed circuit for left turn. To alter the switch for this operation, simply bend the contact leaves carefully.

Testing the outfit. Use a low-range milliammeter to adjust receiver plate current as in the photo. Then, leaving out the motor plug, turn on the transmitter, receiver and SW2 switches and see whether the motor relays stay closed (a magnifying glass may help). Then move the steering switch each way; first one, then the other motor relay should open.

Now hook the milliammeter in RY5 at the point X in the drawing. With the transmitter pulsing, it should read about .5 ma. If it is much less, reverse the transformer primary leads P.P. If it is still low, better check the rectifier and condenser hookup, which must be as shown, with the K on the rectifier toward the transformer.

Next, push the transmitter reversing button. The current in RY5 should rise to about .9 ma. Adjust armature tension until this current operates RY5 reliably, when the reversing relay RY4 should work. If RY5 does not release promptly, throwing the steering switch to either side an instant should kick it out.

If the tractor turns left when you push the steering switch right, simply reverse the leads from the receiver relay.

# X New Tools

1 Circuit Tester Fits Pocket. House circuits, shop motors and electrical appliances can be quickly checked for either voltage or amperage with this inexpensive, pocket-size meter. To measure amperage (left, above), the meter is simply hooked

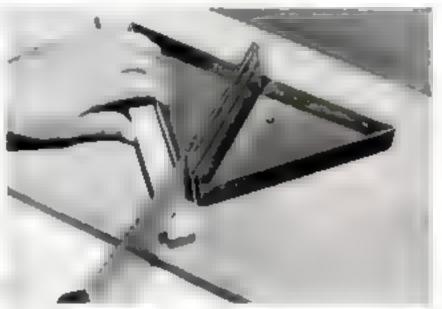

around one of the two circuit wires. To check voltage (center), test leads are plugged into the back. The meter will measure up to 25 amps and up to 250 volts. A separate plug-in accessory with a hole in the center (right) divides a two-wire line, making it easy to hook the meter over one wire without cutting into the cord. A switch also makes it possible to multiply low readings 10 times for greater accuracy.

2 Drum Sander Has Three Sizes. This drum sander for %" electric drills lets you choose three sizes of sanding sleeves without switching to other attachments. A telescoping arrangement takes 1", 2" or 3" drums, and a free-wheeling pilot bearing on the outer end provides a handgrip to steady the drum for better control.

4 Grinder Has Hone, Too. All types of sharpening can be done on this grinder-hone. The grinding wheel turns at 3,000 r.p.m., while the oilstone on top is geared down to 110 r.p.m. The two-sided hone, which can be quickly lifted off and turned over, has 120 grit on one side for whething and 320 on the other for final honing. Sanding, buffing and brushing wheels can be mounted on the left-hand end of the shaft.

Further information on these products can be obtained from I. Peramid for rument Corp. Lindmod. 1.1. Berteam Engineering and Supply Co. 312s Harrison, Nr., Kansas City, Mo.; S. Engle Products. P.O. Box 834, Meriden. Conn., 4. Atlan. Prest. Co., 2542 N. Pitcher St. Kanamazoo, Mich.

3 Miter Guide Can't Wobbie. You shift the work instead of the saw to change the cutting angle on this heavy-gauge steel miter guide. The single long slot keeps the blade from wobbling, can't wear and makes it easier to visualize intricate cuts. The two metal triangles are simply screwed to any bench or board.

Back-yard mechanics aren't lazy—just too smart to hitch their backs to a job a put-put can do better.

# Gardening with Gasoline

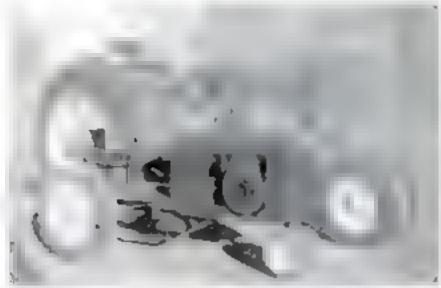

Sporting wire wheels like the flashiest cars, Joseph Jacobs' big homemade tractor pulls a full-size harrow. It can also power a 4' sickle mower and an orchard-spray pump, both homebuilt. A centrifugal clutch on the engine provides simple control with a single lever.

THE handy men who make their own garden tractors don't give an inch to the professional designers of commercial machines. Their homemade rigs appear in as many shapes and sizes, will do as many different jobs—sometimes more—and almost always boast a far more unusual ancestry

Some are as hig as respectable farm tractors. The one shown at the top of this page, built by Joseph H. Jacobs of Osseo, Minn., started out as some 6" pipe and a collection

of auto parts. The pipe was welded into a frame and fitted to take the engine exhaust so that the frame also serves as a muliler. The seven-hp, engine drives an automobile rear axle, shortened 6" at each end, through two car transmissions. This gives a wide range of speeds for efficient operation of a number of implements. The tricycle design permits the tractor to turn in its own length.

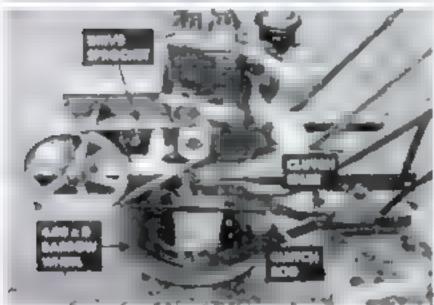

Another enthusiastic tractor builder, Robert K. Chess of Kelso, Wash., has made a

Junior job. Shown alongside a full-size tractor, Lester Foulke's midget is powered by a six-hp. four-cycle engine. The drive is through a gear-box to the transmission and differential of a '37 Hudson. Top speed in high is eight m.p.h.

Powered plow handle. Hitching a X-hp. gas engine to a light plow handle made this maneuverable garden cultivator. One of several types built by Robert Chess, it has a ratchet on each wheel to let either stop for turns.

With just one foot on the ground, this lk-hp, engine does chores from cultivating to snowplowing. Bradford Dittmer of Bellmore, N Y, made it. Belt, reduction gear and bicycle chain (directly above) give over-all ratio of 33 to 1. Clutch on left grip (right) must be held, giving quick control.

profitable sideline out of assembling machines on order. Into some of his larger rigs have gone engines from a '28 Whippet, a Model A Ford and a Durant four.

At the other end of the scale, all kinds of walking tractors have been built, some no bigger than a power lawn mower. One of the most unusual is the "Lattle Cat" made by D. F. Meyers of Ashland, Ky. It rides on crawler tracks that Meyers reworked from a war-surplus bomb-carrying dolly. A 1%-hp. Briggs & Stratton engine drives it.

In-between in size are scaled-down versions of commercial farm machines, resembling kids' toy tractors but able to do real work. Often they are careful copies. The one shown on the opposite page, the work of Lester T. Foulke, Cheyenne Wells, Colo., even has the name painstakingly painted on.

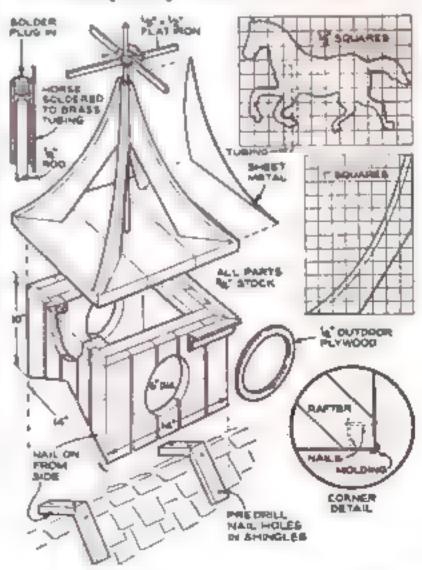

# Cupola and Vane Trims House Roof

This midget cupola with its sassy little weather vane will set any house off from its neighbors. You can add it without lifting a shingle.

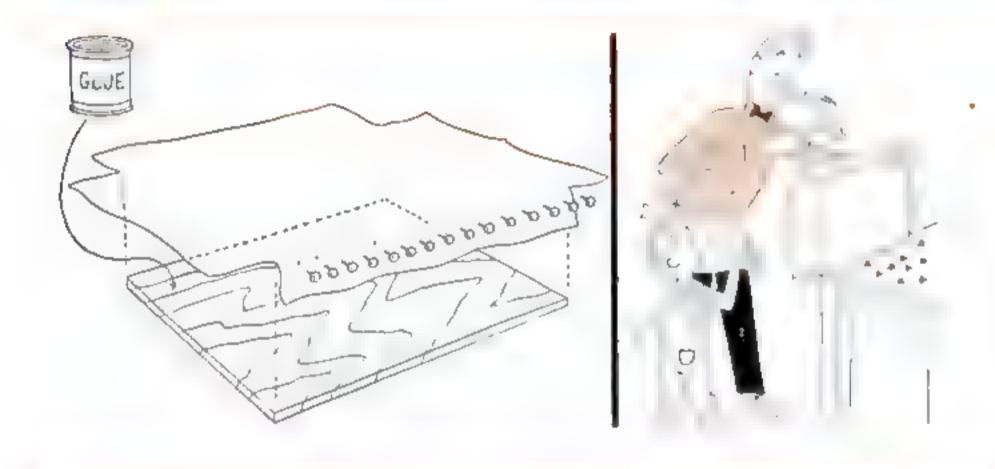

The body can be built up of one-bythree stock (actually %" thick) with
cleats and butted or mitered corners.
Use brass or copper nails. Four rafterlike pieces on a flat top support the vane
shaft. Trace around two while holding
paper against them to get a pattern for
the sheet-metal roof sections. Solder the
corners or cover with molding as shown.

Louvers inside the windows can be built up of wood or metal, or bought in the form of attic vents. Solder the sheet-metal horse to a bushing that turns on the fixed shaft. Solder cutout metal letters to the compass points if desired, and clamp the points on with brass bolts.

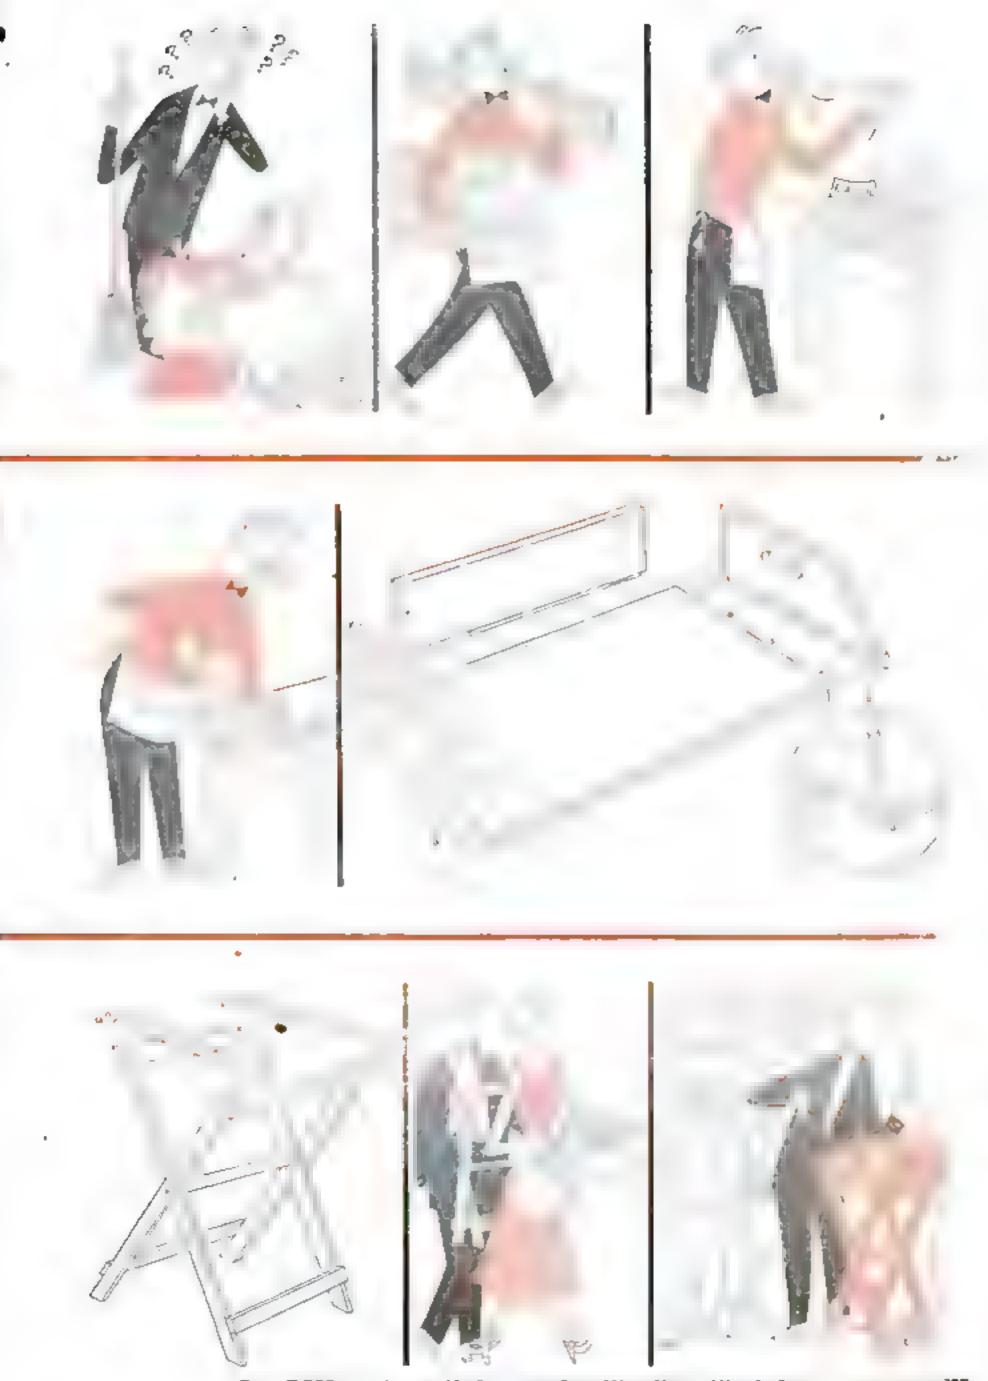

# Wordless Workshop

196 POPULAR SCIENCE

See PSM next month for another Wordless Workshop. AUGUST 1952 [9]

Shower coming? Then grab one of your plastic covers and spread it over the outdoor furniture to avoid lugging the furniture around. The 9'-by-12' size shown here was originally made by the Sydney-Thomas Corp., Cincinnati, for use as a painter's drop-cloth.

# You Can Use Plastic Covers

Big sheets of transparent, weather-resistant polyethylene are now available at low cost to handle various chores in and around your home.

Garage the bikes under a cover each night if there's no space elsewhere. The plastic won't hurt chrome or paint, and isn't affected by freezing, hot sun, acids or alkalis, or petroleum products. Prices are about \$3 for the 9'-by-12' size and \$1.30 for the 6'-by-9'.

Protect workshop tools from dust. It takes only a few seconds to throw one of the big sheets over all your important equipment.

- 6. To protect a bush from frost.
- 7. As a trailer cover.
- 8. As a mattress cover.

ROTTED AND RICKETY steps above were replaced by set at right.

# Simple Steps Dely Rot

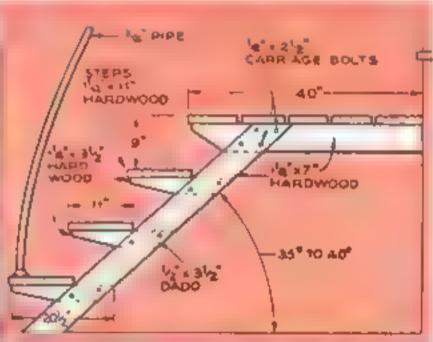

ONCE your outside steps begin to go, there's not much you can do except replace them. Rot at ground level or in the corners where the treads meet the risers causes deterioration that is difficult—even impractical—to repair. These steps, designed not to let

water accumulate in their structure will outlast a conventional design, and their construction is much simpler. It is not necessary to lay out and notch the stringers, as dadoes secure the step supports.—Harold Kelly, Bergenfield, N. J.

STRINGERS are fastened to blocks screwed to wall. Lower ends rest on concrete or flag-stones. Step supports are bolted into dadoes cut in stringer sides to prevent sagging.

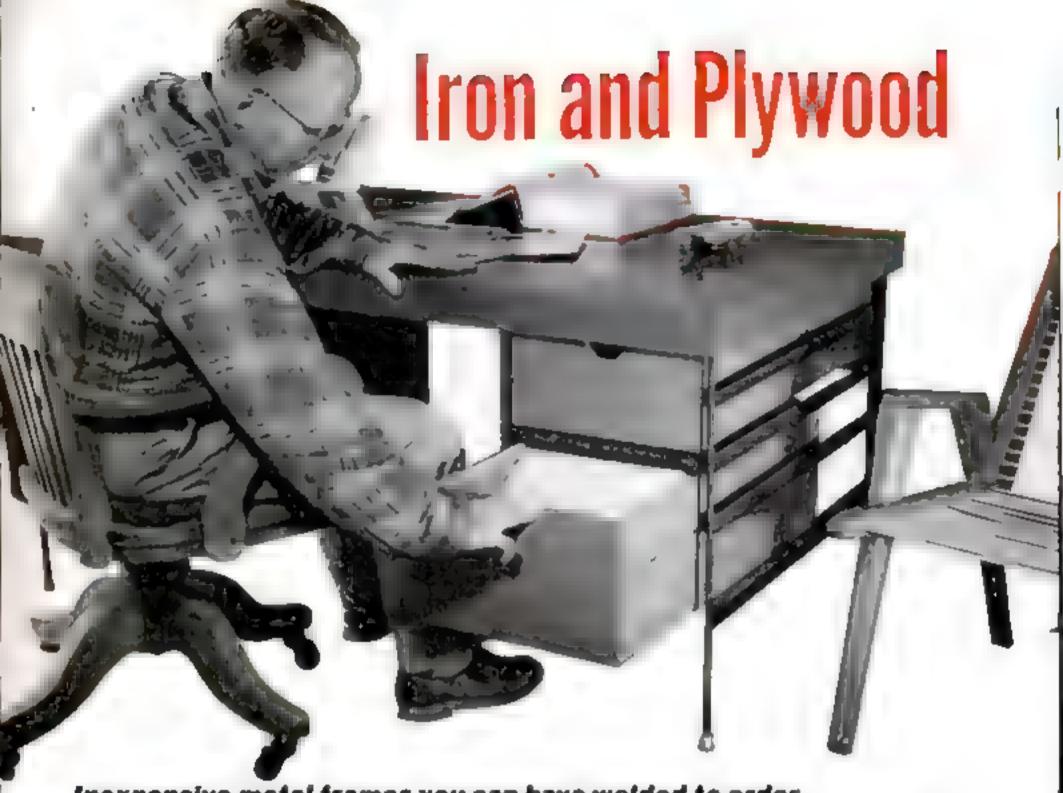

SIDE ELEVATION gives proportional dimensions; height and width are made to suit your doorway. Handrail is 34" pipe supported at each end by a cast-fron floor flange.

# Adjustable Paper Punch Spaces Holes to Suit Binder

Two or three dime-store hole punches can be set up on a slotter strip of metal (such as a box-lid bracket) to enable you to quickly punch papers to fit in ring binders.

Drill the back of each punch and thread or solder a short machine screw in each hole to serve as a stud. Use wing nuts to clamp the punches to the bracket as shown at right. Attach a small metal angle to one end of the bracket to guide the edge of the paper.—Andrew Brennan, Philadelphia.

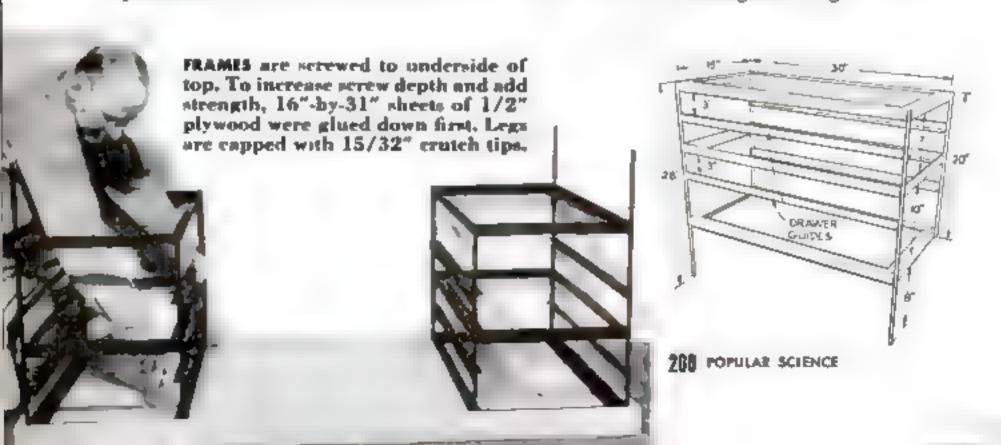

Inexpensive metal frames you can have welded to order support a big working surface and four roomy drawers.

J UST because a desk is meant for working doesn't mean it has to be built like a battleship and look just as frightening. The one I made combines the sleek lines of wrought iron with a sturdy plywood top and drawers.

Painted in bright enamels that contrast with the rich black of the metal, the desk is as pleasant to look at as it is to work at.

The iron frames also saved a lot of tricky carpentry on joints and drawer slides.

Making the frames. Each leg-and-drawer frame consists of three 15"-by-30" rectangles made from 1"-by-1"-by-" angle iron. These were joined at the corners by four "metal rods. The two inner rods are the height of the drawer sections, while the outer two are full length for legs.

# Build Sturdy Modern Desk

To hold the drawers, extra 30" lengths of angle iron were added to the sides of each frame 3" down from the upper two rectangles. Grooves cut in the sides of the drawers slide on the angle irons, so that they serve as both supports and guides.

I had a local welder make up both frames for me for about \$30. If you can do your own welding, you can probably cut this

cost in half or more

Top looks massive. This is a 32%-by-60" piece of %" plywood, edged with a 2" strip nailed and glued to the underside all around. The edging gives it the appearance of a thick, solid top at a fraction of the weight and cost. I used a plastic faced plywood, made especially for painting. This costs a little more than regular plywood, but produces a really shok firmsh

The 134" by 30" drawers are also plywood. The top two are 65" deep and the bottom two 95" deep. They're assembled and grooved as shown in the photo-Paul

Corcy, Sonoma, Calif.

prawers are ½" plywood for ends, ¼" plywood for sides and bottom. Front and back have ¼" rabbet into which sides and bottom are glued and screwed. Grooves on sides to take drawer guides are 3 16" wide, ½" deep and 2½" down from top. Drawers are painted green flat enamel, top red, frames black.

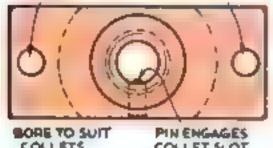

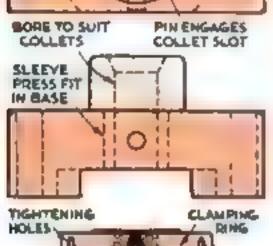

in AUGUST for heat exhaustion. Caused by heat from sun or weather or boiler rooms, it's different from sunstroke, caused directly by sun.

SALT tablets will help prevent heat exhaustion. So will salt swallowed in water. So will loose clothing, drinking fruit juices, and avoiding alcohol. Symptoms of heat exhaustion are cold skin, pale face, sweating, fainting, sighing, cramps and high temperature. Lay a victim flat on his back, keep his head low, and keep him warm. Loosen clothing and give him hot coffee, or aromatic spirits of ammonia. Give him salt in water. A victim of sunstroke has a dry, hot skin; a red face and fever. Put cold cloths on his head, and give him cool water but no coffee or stimulants. For either heat exhaustion or sunstroke, call a doctor at once.

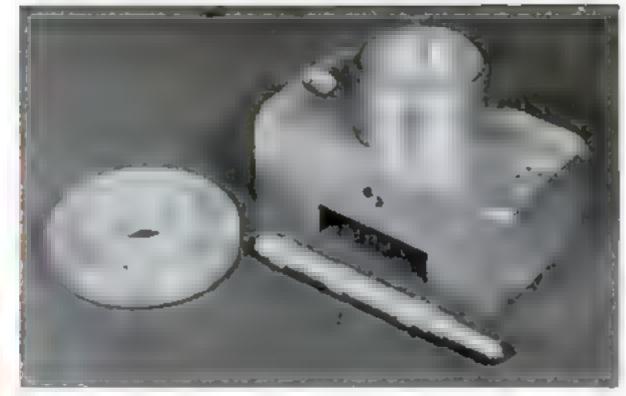

# NEW Shop Ideas

DR 36 FOR HOLD-DOWN BOLTS

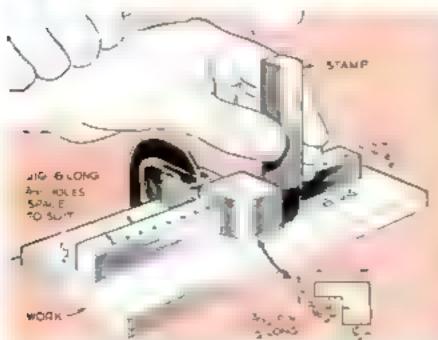

Extra Duty for Collets. This collet block will bring those collets out of quiet retirement on the rack behind the lathe and put them back to work.

Shown below are three uses to which the block adapts them: left, as an auxiliary vise for the drill press; center, clamped to the lathe face plate for turning eccentric jobs, right, holding stock for milling or slotting operations.

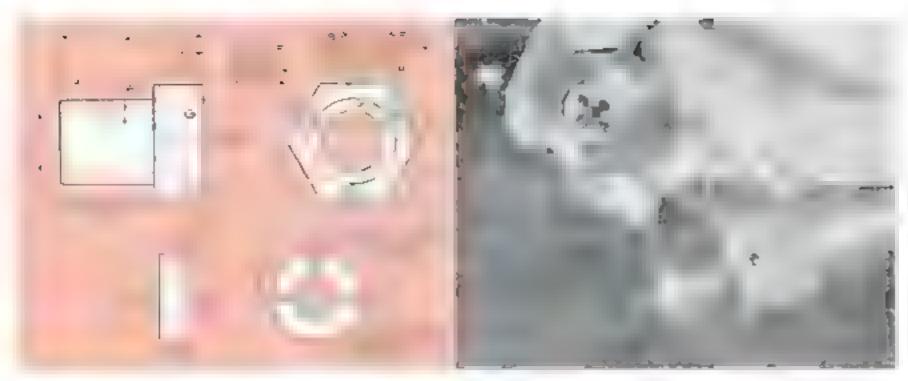

The block consists of a base, squared on all sides, that supports an internally tapered sleeve bored to receive the collets. The collets are drawn tight on the work by a clamping ring threaded to fit the collet threads. A tightening pin fits into boles drilled around the clamping ring to turn it on the collet threads.—J. C. Magee, Schenectady, N. Y.

Jig Guides Letter Stamps. If your metalstamping jobs resemble a schoolboy's printing, you'll find good use for this jig that keeps the letters in line and spaces them out evenly.

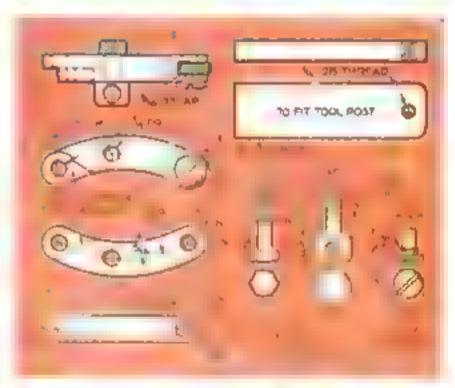

The body of the jig is cut from %" steel, and the front edge filed straight. The spacer block is fitted with a steel pin that is moved progressively along the row of holes drilled in the body to set off the spacing of the letters. The corner formed by the spacer block and jig body positions each letter accurately.—Pet. Philip McCafferty, Fort Bliss, Tex.

Tailstock Die Holder. You can speed up your threading jobs with this die holder, and forget about resetting dies. Each die is set once and locked in a round collar that fits into the die holder. The holder also permits longer threads to be cut, as it fits over the tailstock ram, not inside. This means

that the work can pass through the die to the full length of the ram. Made a sliding fit on the ram, the holder is kept from turning by a pin that rides in the ram keyway. This pin also acts as a safety, as it will shear off if the die runs up against the chuck or a shoulder on the work.

Emergency Live Center. Faced with a super-accurate job to set up between centers and a live center that's worn or scored, you can save the day and do the job by chucking a piece of cold-rolled rod in the three-paw chuck and turning a 60° point on it. Set up the job without disturbing the newly turned center, for it will not be accurate once removed from the chuck. The lather dog can be driven by one of the chuck jaws. —Joseph Tracy, New York (

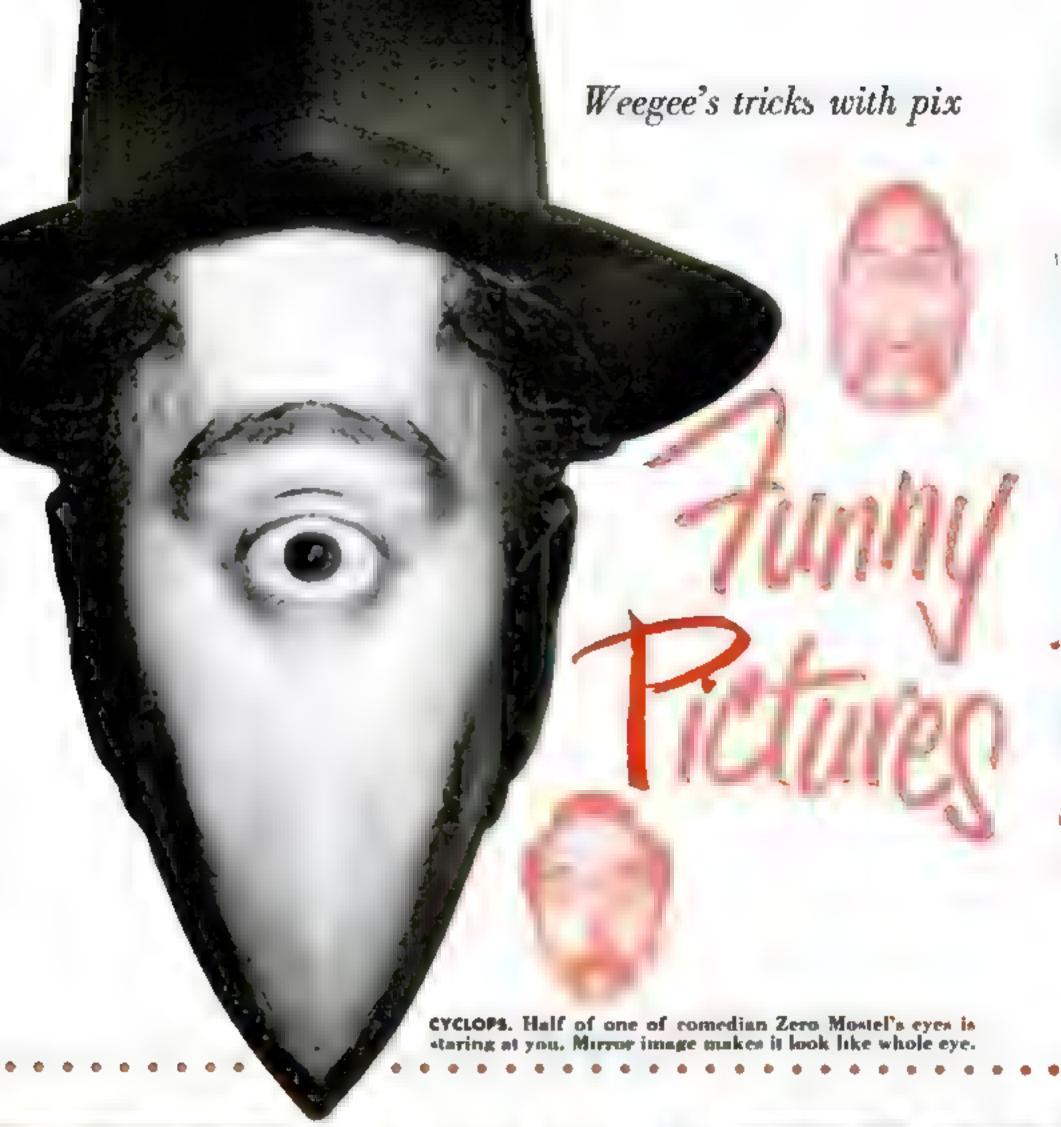

Knurling Tool Saves
Lathe Bearing. This
knurling tool squeezes
atsert on the work
without producing the
excessive side thrust
on the headstock bearing that an ordinary
knurler does. Adjusting the Allen-head
serew on the side of
the tool forces the

Double-Ended Allen Wrench. Both screws and nuts can be tightened with this little homemade tool. One end is fitted with a short length of hexagon rod and works like an -Allen wrench; the other end is fitted with an Allen-head screw with a hex opening the same size as the hex rod. This tightens nuts like a socket wrench. Either end can work in tight spaces. The size should be stamped in the center of the steel strip.

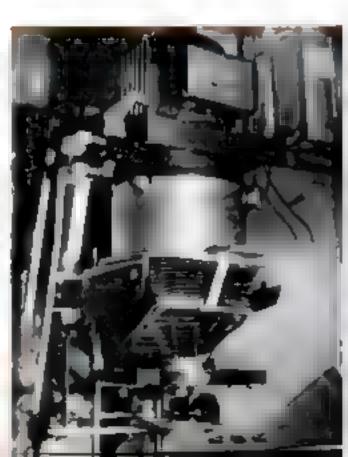

knurls together above and below the work. After a few passes, the Allen screw is tightened to deepen the cut. The tool can be used with either straight or diamond-pattern knurls.—Floyd McGuckin, Ridgewood, N. I.

How mirror photos are made. A beta shaving mirror mounted to touside a less ring does the trick. 204 POPULAR SCIENCE

# give us a new slant on some familiar faces.

## By R. P. Stevenson

THE curious pictures on these and the next two pages came into being because a photographer accidentally gave himself a hot mitt, manual counterpart of the hot foot.

The photographer was Arthur Felig-Weegee to New York and Hollywood pals and readers of his books. The hot mitt occurred when he triggered juice into a big flash bulb without first letting go of it. Unable to manage a camera until his baked hand cured, he whiled away his time doing one-handed tricks with an enlarger.

Drawing on a huge file of negatives of the famous and almost so, Weegee soon was making two heads grow where only one grew before, turning pinheads into bulgedomes and bulgedomes into pinheads, and pleasing certain mamas by switching an only child into photographic twins,

The equipment for this new darkroom sport was simplicity itself. All that's required is a front-surface mirror held vertically inside the enlarger bellows between the lens and the negative carrier. Weegee uses a metal shaving mirror, cut down and mounted on pivots inside a brass ring.

Originally a New York press photographer, Weegee has been doing special photographic effects for Hollywood movies in recent years. His books include Naked City, Weegee's People and Naked Hollywood.

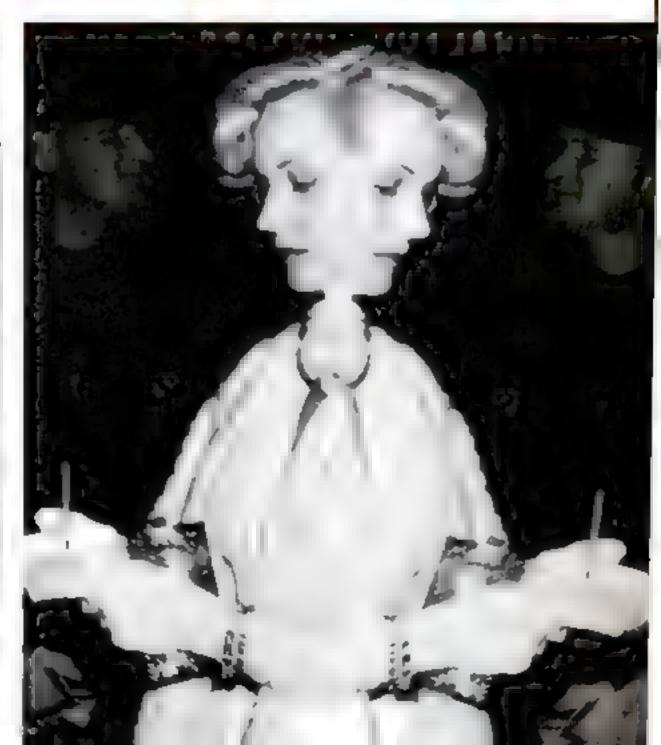

Please turn page for more funny photos.

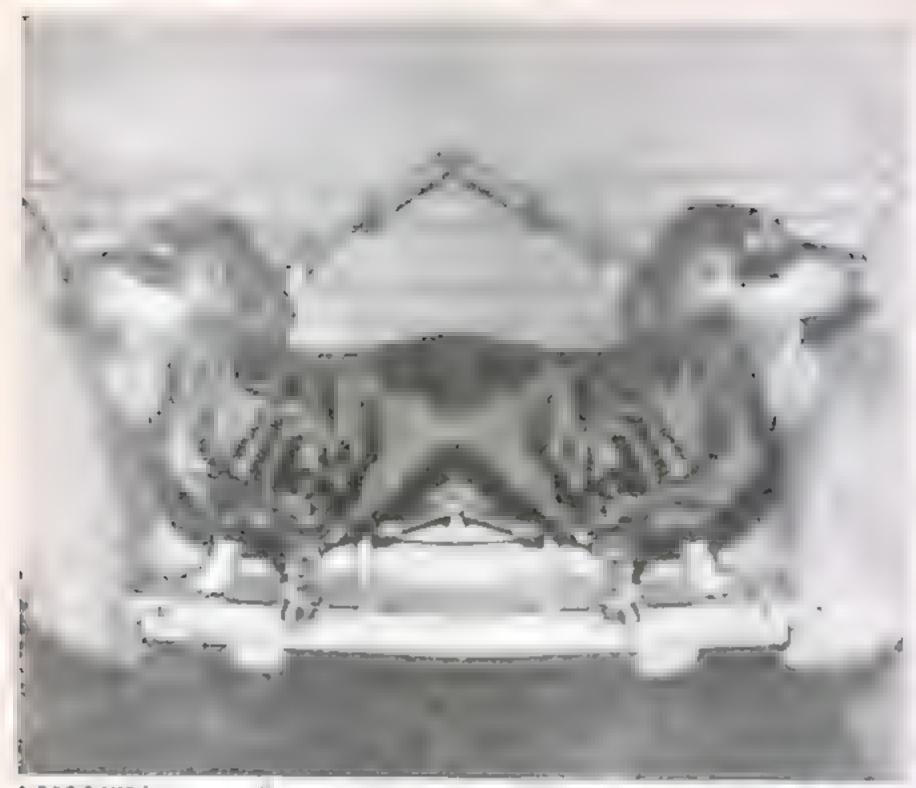

# Made with Minors

"IT'S SO CONFUSING," said actress Virginia Mayo when Weegee showed her this two-faced picture. But her studio liked it, and it was published in Los Angeles newspaper.

A drill press can locate holes with great accuracy if you lend it part of your lathe.

# Lathe Compound Doubles as Drilling Fixture

PUT the compound rest from your lathe on the drill press, and you can spot holes to a thousandth of an inch, or to one degree around a circle. The feed collar gauges in-line spacing, the indexed ring angular spacing.

Work base and table. Face a short piece of heavy round stock, turn the edge true and reverse in the chuck. On the other end turn a tapered stud or bore a recess to duplicate the compound mounting on the cross slide Scribe marks 180° apart for reference with the compound graduations. If yours are on the cross slide, use the lathe index head to graduate the base.

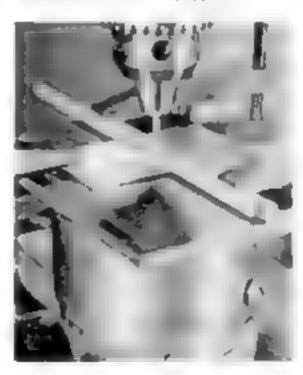

Tap the edge for %" clamp screws, if required. Fit on a 4" by 6" table of %" brass plate with a center screw and a pilot pin. Put the compound upside down on the drill-press table over two parallel blocks. Clamp it with the lathe tool post through the table hole, tightening it against a tool holder. Then mount the base.

Drilling on a radius. To align the swivel axis of the base with the spindle, chuck a dial indicator in an offset mount (center photo). Shift the compound to show minimum run-out around the base. Mount the table. If the work is round, as in top photo, indicate it true also. Set work to the drilling radius with the compound feed.

Spacing holes in line. Advance the compound fully one way, drill a hole in the table, run it back and drill another. Put pins in the holes. Align a clamped on fence with them by inserting temporary spacers, which will determine how far holes will be from the edge of the work. Remove pins and spacers, and clamp work so it touches the fence.—Floyd McGuckin, Ridgewood, N.J.

TO DRILL ON A CIRCLE, indicate base from spindle as above. If work is round, ulign it the same way. For in-line holes (below), use a fence clamped parallel to compound travel. Use centerdrill to start holes.

# "Squeezed" Movies Challenge 3-Ds

(Continued from page 192)

is a technological novelty, and tackle the job of telling super-realistic film stories.

That is what Twentieth Century-Fox has set out to do in a \$4,000,000 wide-screen version of Lloyd C. Douglas' best-selling religious novel, The Robe, scheduled for release late this September. This epic of the young Roman legate who wins Christ's blood-stained mantle under the central cross on Golgotha would be a tough assignment for any director, using tried and proven standard-screen techniques. To make full use of wide screen, it becomes a monumental challenge.

#### Movies on an 80-Foot Screen

Not long ago I saw the results of the first two months of Cinemascope shooting. On a metalized screen which arced some 80 feet across New York City's huge Roxy theater stage, Golgotha came to life again in all its quiet horror. Dark scuds moved sullenly across the sky, and tufts of grass bowed to a wind that swept in fitful gusts from right to left.

They tell me that nearly a thousand workers laid 100,000 board feet of lumber under the 55 tons of dirt used to create that hill; that they blended 300 sacks of casting plaster, 150 bags of cement, 100 sacks of hardwood plaster, 60 tons of sand and 10 bales of fiber to form the bleached outcroppings of rock that fell away to a gigantic backdrop painting of Jerusalem which stretched 650 feet across my line of vision.

#### Enough Light for 1,200 Homes

They say that the 291 blazing lights which illuminated this \$55,000 wide-screen setting drew 35,000 amps—enough to turn on all the bulbs in 1,200 five-room houses, and that the heat produced by this blaze of incandescence would have been intolcrable if 1,000 tons of ice hadn't been melted daily in the big airconditioning units which blew 60,000 cubic feet of cooled air, every minute, across the studio floor.

### "Squeezed" Movies Challenge 3-Ds

[Continued from page 210]

That stupendous Golgotha set is only one of 39 used in the filming of The Robe. One extends more than 200 feet from the camera to a distant throne. That means that lenses must be stopped down sharply to merease their depth of focus. Under the hopped-up lighting, any imperfection in the scenery stands out like a cracked ceiling in the Waldorf-Astoria.

Broadened real-estate, however, is not the only key to Caremascope's dramatic punch. For years, the three-units-high, by four-units-wide, standard movie frame has been a miniature picture window through which you watch a story unfold in peephole glunpses. Each time a director wants to widen your view, he moves this window to the right or left, and it takes you the better part of a second to readjust your vision.

# New Finds Tell of Monster Cave Bear [Continued from page 116]

with their other accomplishments, they were skilled artists, and ornamented the walls of their caves with pictures of animals of their time, including the Great Cave Bear.

Cro-Magnon artists and later ones made their cave drawings, paintings and carvings, not alone for art's sake, but as primitive magic to assure plentiful game and good luck in hunting it. So concludes a French expert, the Abbé Henri Breul, who has spent a lifetime photographing and studying prehistoric cave art. As he explains it:

"To picture a mare would promote the natural increase of horses. To portray the Great Cave Bear with many javelins sticking in him would assure success in hunting him."

#### Cave Drawings True to Life

These cave-man artists, he points out, were hunters whose lives depended upon accurate observation of animals. Hence, there is every reason to believe that their pictures are true to life and "have a genuine zoological value."

In fact, regardless of date, two attempts to visualize what the Great Cave Bear looked like stand out above the rest. One is a prehistoric outline picture of it, a rock carving that may be 20,000 years old, found by Abbé Breuil in a cavern at Dordogne, France. The ' other is a modern reconstruction of it in plastic, drawing upon the best available data from every scientific source, at the University of Vienna. And the striking thing about them is that Stone Age artist and present-day modeler arrived at a virtually identical picture of the Great Cave Bear. END

#### "Golden Boy" of Motorcycle Rucing [Continued from page 123]

mg demands by using hand exercisers, doing pushups, running and swimming. He joins a Y for regular exercise in winter.

He owns four Harley-Davidsons, and takes their engines entirely apart about every two weeks. This is done to make sure that no parts are worn-out or too loose. If such conditions were ignored, an engine could fly apart at high speed.

When he gets a new engine, he takes that all apart, too, but for other reasons. He alters the four camshafts in a special, secret way and lightens up all the reciprocating parts. He and his mechanic slightly change the contours of the combustion chambers. With meticulous care, in reassembling the engine they fit the parts so that they will be as nearly frictionless as possible.

"That's the biggest speed secret there is, right there." he says.

#### Hurt Only Once

Goldsmith has been scraped and bruised a few times in the past seven years but badly hurt just once. That happened in Cleveland in 1948, He had taken a fall to avoid hitting someone else. In the few seconds that he lay at one side of the groove, another rider whammed across his feet and broke both of them. That put him out of racing for a year and a half, But when he was fully mended he went back to it with few misgivings and no trace of a limp.

When asked how long he intended to defend his present titles and try to win fresh ones, Goldsmith said, with a slow grin, "Well, the oldest guy competing in the Nationals last year was 55. That gives me quite a spell of racing yet."

#### it's Not Easy

"For a man who hasn't any experience you certainly ask a high wage," said the employer to the young applicant.

"Well," replied the prospect, "the work is so much harder when you don't know anything

about it."-Clay.

# FULL-TIME POWER STEERING

A superior feature available only from CHRYSLER CORPORATION

Guided by one funger on the steering wheel, a Chrysler-built car slashes through hub-deep ocean surf—a tough spot for any car to be in—except with full-time power steering.

When you park, or turn a corner, or drive through skittery sand, you burn up muscular energy. The result is tension and driving fatigue.

Now Chrysler engineers have taken the fatigue out of driving. They've harnessed hydraulic power to do 80% of the steering for you!

Steering now is absolutely effortless! Your finger tip turns your car wheel with ease, even at a complete standstill. Parking is a look, a turn, a straightening up, and you're in!

What are the superior features of this exclusive Chrysler system?

Chrysler's revolutionary power steering system reports for duty the moment you start your engine. And it stays on the job every minute your engine runs! It responds instantaneously—unlike other devices, which do not go to work until the driver has applied four or more pounds of steering pressure.

This is the only system that enables you to drive hour after hour without steering-wheel weariness. Chrysler's all-the-time steering is so relaxing that many doctors now are willing to allow persons to drive who be-fore could not stand the exertion.

Creative Engineering that brings you the good things first. A Chrysler-built De Sote cuts effortless capers in sand and ocean surf at Daylona Beach, Florida. It demonstrates the handling same and positive safety control of full-time power steering, another Chrysler Corporation "first," now available on Imperial, Chrysler and De Sote sars.

Even the steering ratio has been greatly reduced. Other mechanisms require up to five rotations of the steering wheel to turn through a full arc. The Chrysler system requires only three. This means faster, safer steering than you can get with any other available system.

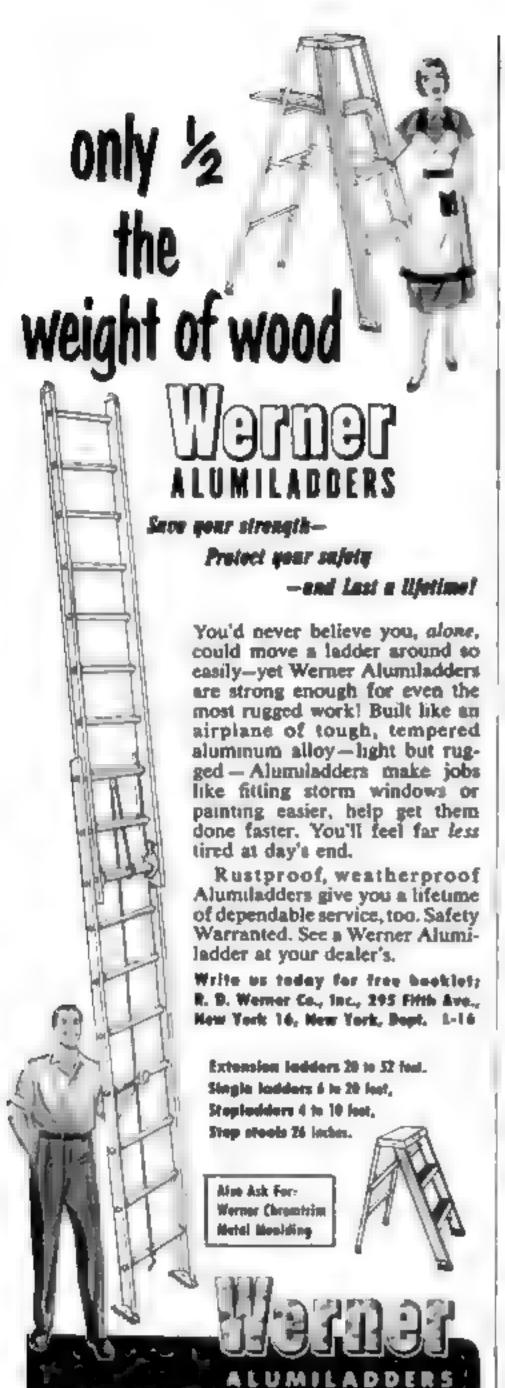

The Chrysler system also soaks up road shocks. Its hydraulic action helps hold your car serenely on course—even if you drive over ruts or suffer an unexpected blowout.

Chrysler engineers introduced full-time power steering for passenger cars in 1951. This Chrysler "first" is another example of engineering leadership that continually, year after year, puts more value and worth into all Chrysler Corporation cars.

#### Gus Peps Up a Tired Truck [Continued from page 160]

"I didn't have any trouble," Glen was saying, "until I started to work on the harvest last week. That is, except for the broken butterfly shaft."

"Broken butterfly shaft!" Gus was all ears now. "Those shafts wear, but they don't often break. Something must have jammed it."

"The throttle stuck at slow speed," Glen explained, "So I rammed my foot down hard on the accelerator and the motor stopped. It took me a while to find out that the cross shaft in the carburetor, where the butterfly valve is attached, had let go. The truck quit almost in front of the Danesville junk yard, so I had them put in a used shaft, That fixed things up as good as new."

#### Gus Fumbles Through Tool Kit

When they got back to the Model Garage, Gus got down and wheeled over his tool kit. Then he began fumbling through it, as though he was looking for something he couldn't find.

"Funny." he said. "I need a real small screwdriver. And I don't seem to have one here."

Working on the grease rack, Stan Hicks cocked a quizzical ear. What was the old fox up to? Cus had all kinds of screwdrivers in the kit drawer.

Glen got his tools out of the truck and offered Gus an eight inch driver

"This," he said, "is the smallest one I've got."

"Then how did you manage to get out those two tiny screws that held the butterfly to the broken cross shaft?"

Glen looked puzzled.

"Why, I didn't have to, Mr. Wilson. That butterfly valve was loose in there. I just lifted it out."

Gus kicked a trough under the radiator, and slid in beside it to turn the drain cock. When he had run all of the water off, he removed the engine head and called Stan Hicks over.

#### Stan Mans the Crank

"Turn her over slow with the crank," he told his helper.

As each intake valve came up, Gus thrust a tiny inspection mirror underneath it, and flashed a pencil light on the mirror, so he could see the reflection of the valve facings.

#### Gus Peps Up a Tired Truck [Continued from page 2/8]

On cylinders 3 and 4 he found barely visible marks on the newly ground seats. As he turned to face Glen and Enid there was a smile of complete satisfaction on his rugged features.

"Your troubles are over, kids," be told them. "The two screws that held the old butterfly valve to the carburetor shaft worked loose. That let the butterfly valve cock in the carburetor throat, and jam. When you rammed your foot down hard on the throttle, the shaft broke. You had the junk-yard boys install another shaft, but you forgot the two screws from the old one. Right now, they're down under the intake valves of Numbers 3 and 4."

"But I don't get it, even now," Glen sputtered. "The motor idles good. Why in the world should it only miss when it turns over fast?"

#### Gus Solves the Problem

"That's easy," Gus grinned. "The two screws are under the valves in the intake passages. When the engine's idling, there isn't enough suction to lift them up under the valve faces. But there is enough when the motor revs up. The screws are too large to pass completely under the valve heads and into the cylinders, but small enough to get under the valves and hold them open. When you idle down again the suction drops off and they fall back into the little pocket by the valve stems. Now, we'll just pull those two intake valves, remove the screws, and grind the valves—they're a bit rough."

Gus got busy, trying to ignore the appreciative eyes of Enid Bishop. There was a bigger reward in this job, he told himself, than the small bill Glen would pay up when the harvest was in. One of these fine days Gus Wilson was going to be invited to a wedding.

Next month: Gus saves the old homestead,

#### **Deprived of Its Prey**

A MOUNTAINEER, seeing his first motorcycle roaring along the road, raised his rifle and banged away

"Did you git the varmint?" called his wife.
"Hit it but didn't kill it," came the answer.
"I can still hear it growling—but I sure made it turn that pore man loose."—L & N Magazine.

#### **SELF-CONTROL STARTS HERE**

#### OIL-CONTROL STARTS HERE

CAR PERFORMANCE

To stop oil-pumping, replace worn engine connecting rad bearings

Trouble sometimes comes from unexpected quarters. An oil-pumping engine is an example. You may blame the piston rings for oil pumping caused by excessively worn engine bearings. Correction must

shorten the tream bearings! They shorten the life and decrease the efficiency of the best of new piston rings. Give new rings a chance to do their own job—check for worn engine bearings, too! Replace, in sets, with Genuine Federal-Mogul Oil-Control Bearings for renewed power and economy. Ask your mechanic!

#### FEDERAL-MOGUL SERVICE

#### He Recaptures Aviation's Old Days [Continued from page 68]

eran pilots to fly essential cargoes from the U.S. to India.

In 1946, he flew a P-38 in the Bendix Race from Los Angeles to Cleveland. Among those who saw him off when he left. Minneapolis was his daughter, whom he took aloft for the first time when she was a baby, strapped to his lap. This time she had two of her three young sons with her. Reporters promptly dubbed Bullock the "Racing Grandpa."

#### Duplicated Parts from Memory

The experience that Bullock gained restoring the Curtiss pusher that his father gave him, and patching it whenever he crashed it, made it relatively easy for him to build a copy of the plane years afterward. He made no attempt to locate original Curtiss parts, assuming that would be impossible. Instead, from an excellent memory and from pictures in his scrapbook, he duphcated his Curtiss with modern parts and materials

Bullock would have liked to use wooden struts and tail surfaces and bamboo booms in the copy, like those on his first Curtiss, but he decided instead on steel piping and modern fabric.

#### Wings Proved Problem

He knew, from repeated practice in the old days, how to build the wings, but he didn't know what their degree of curve should be. This was of vital importance. Being unable to drop in at the Smithsonian Institution and take wing measurements of the only Curtiss pusher he knew to be in existence, he devised an ingenious substitute. He selected the best side view of his old plane from his scrapbook and had it greatly enlarged. Then, calling upon the mechanical-drawing knowledge he had acquired in high school, he plotted the curves of the wings from the photo.

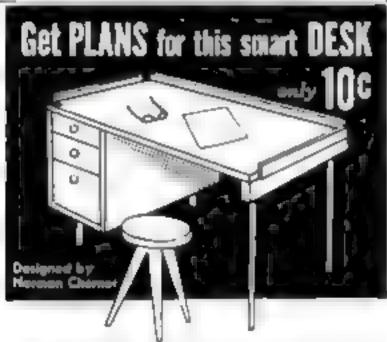

The wings of his present plane were made exactly as the original ones were. The spars are of 1%-by-2%-inch clear

spruce, laid flat instead of endwise. The ribs are of 1%-by-%-inch laminated spruce. The frame is covered with ordinary air-

plane-wing cloth.

Bullock, however, added certain refinements that Curtiss hadn't dreamed of-instruments, for instance. All the original pusher had was an ignition switch. Bullock added an altimeter, a tachometer, an airspeed indicator, oil gauges and a primer-all from a Piper Cub-and installed them on a horizontal panel at the right of the pilot's seat.

The original overhead fuel tank held eight gallons of gasoline. Bullock prefers a streamlined 25-gallon substitute.

In the original plane, the pilot worked the ailerons by means of a shoulder voke. "You leaned to the high side in those days," Bullock explained. Now his ailerons, in conventional fashion, are operated by the steering wheel.

#### It Is No Speed Demon

The present Curtiss retains one disadvantage that the original plane had. It can't be steered on the ground, If Bullock wants to turn at one end of his 900-foot turf runway, he has to climb down and lift the tail of the plane around.

The entire job of duplicating Bullock's old Curtiss was finished in two months, and the plane flew satisfactorily on its first trial.

Glenn Curtiss once set a world's speed record—an impressive 61 miles an hour with the original model of this plane. The best Bullock has been able to do with his copy is 55 miles an hour. This was no surprise to him, however. Even in his original Curtiss-made Curtiss, he once lost a straightaway race with a Lake Minnetonka interurban trolley, END

REDMAN TRAILER CO., ALMA 31, MICH

His thrust is instantaneous when he pushes on the control levers.

How soon the turboprop will become a commonplace on U. S. airlines depends in part on when they want it. The armed services have Allison-powered turboprop fighters, patrol planes and transports a-building or on order. British European Airways already has some turboprops in service.

#### May Reduce Airline Fares

Turboprop airplanes have qualities of their own that neither jets nor piston airplanes can match. They are not as fast as jets but they're more economical. They fly farther on a gallon of fuel. They can get into and out of small airports that jets—and even the bigger piston transports—can't negotiate.

Turboprops use more fuel than piston engines but they weigh a lot less and therefore can carry more, and the fuel costs only half of what high-octane gas does. It's possible that the turboprop eventually will help reduce airline fares even below today's "coach" or "tourist" rates.

A turboprop will produce twice the horsepower of a piston engine for each pound of weight. A Turbo-Liner pilot, anxious to get home, was glad of that the other day. Still a good many miles from Indianapolis, one of his engines swallowed an unidentified solid object. The compressor was damaged. Automatically the engine shut down, Automatically the prop feathered.

But the plane wasn't far behind schedule when it landed. It raced home on one engine—at 220 miles an hour.

Next month POPULAR SCIENCE will show you how to build a turboprop model that flies and sounds like a big plane.

PLANS

# Sliding Door Turns Corners

#### Unit made of wood strips slips out of sight in cabinet ends.

CABINET doors that slide around a rightangle corner are often the solution to a home-construction problem where conventional swinging doors would take up too much space or he skull-denters

These doors require a quantity of straight wood strips, not too wide and not too thick. I used redwood half-round, the kind intended for screen molding. These strips are about 5-16" thick and %" wide.

Cut them to equal length and arrange side by side until you have a door of the desired length. Then sand them smooth and apply shellae, lacquer or other finish to the curved surfaces.

Fasten together by pressing strips of gimmed paper against the flat sides of the half round, aligning the paper about 1/16" from each end. Cut a piece of thin, tough cloth large enough to cover the back of the entire door except where the paper strips have been applied. Glue the cloth in place.

On my doors, I used two X" by 3" wood strips for the vertical end pieces, cutting a tongue and groove to form an interlocking, dust-resistant joint. Rout finger grooves in these.

The doors can slide in grooves either routed in wood strips or formed by fastening two parallel strips to the top and bottom of the cabinet Parts of the tinm can serve as outside guides. At the cabinet ends, install curved wood blocks to make the door turn the corner. If the cabinet is to have shelves, install false end panels between the top and

bottom of the cabinet to support them. The doors then slide into this recess, between twin guides at the top and bottom.

For a narrow cabinet, a single door sliding into a recess at one end will do the job. If the width of the cabinet is not too much more than twice its depth (front to back), two doors are best. These should meet at the middle of the cabinet. For an extremely long cabinet, more than two sliding sections could be used, only the end ones being required to turn the corners.—Walter E. Burton, Akron.

SANDING BLOCK for smoothing half-round strips was made by boring hole through block, splitting it in half, and gripping halves in vise. Let vise grip ends of sandpaper, too.

CLOTH IS GLUED to strips to hold them together and make door dustproof. Apply adhesive to the cloth in a band two or three strips wide, press this area in place and repeat.

#### New Magic Bullet Cures Old Disease [Continued from page 89]

Did it have such a strong hold on the penicillin parts of the molecule that the valuable antibiotic would never get loose to kill microbes? No—the grip could be broken in the body and penicillin would be released slowly.

#### They Tested 500 Different Chemicals

Could some related substance do a better job? Apparently not—Dr. Seifert and his co-workers tested about 500 different chemicals and the DBED-peniculin compound still held No. 1 spot by a wide margin. Animal experiments indicated that it wasn't poisonous.

The groundwork was completed. But new drugs have to pass a long barrage of trials on carefully selected patients before they're accepted for general use. For a while it seemed that Bicillin would never be run through such elaborate chinical routines. But during a conference on new products a desperate Wyeth executive blurted: "If we only had something to kill the taste of penicillin!" (That was more than three years ago, when certain penicillin tablets were bitter and nauseating.)

Dr Seifert put in a good word for Bieillin. He'd tried it once and found it quite palatable. So the drug finally came into the limelight, because it happened to be tasteless. But it had a "bonus" effect. Taken by mouth it proved effective as a germ-killer for an average of six hours, despite the destructive power of stomach acids. Doctors soon wondered how long it would last in the form of hypodermic doses—and they found out.

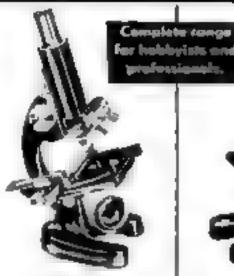

#### How Drug Warks in Body

When a patient receives a hip-muscle injection of 2,500,000 units of Bicillin, the drug molecules are suspended in water, which is soon absorbed in the muscles. This leaves a spherical blob of material about as big as the tip of your little finger. It consists of millions of white Bicillin crystals. The blob dissolves

#### New Magic Bullet Cures Old Disease [Continued from page 2:0]

very slowly, as body fluids break the chemical bond between DBED and penicillin. Potent levels of the antibiotic are maintained in the blood for a month or more.

Drs. Clarence A. Smith and James K. Shafer, assistant chief and chief respectively of the Public Health Service's vital Division of Venereal Disease, who have been directing pioneer chemical studies expect the new drug to play an important role in curbing syphilis among the 2,100,000 Americans who require treatment

All cases reported on so far were those of persons suffering from relatively recent infections. Three to six weeks after contact a chancre or raised sore appears, the telltale sign of primary syphilis. Then there's a "silent" period of up to a year before secondary syphilis flares up, the main symptom usually being a wide-spread non-itching rash. These are the early stages of the disease. Results aren't yet in for advanced syphilis, requiring much longer treatment—and study.

#### Doctor Sees Sharp Cut in Disease

Last year alone about 169,000 early cases were reported. It's estimated that about 20,000 of the group would have developed various forms of advanced syphilis—such as blindness, heart disease, and insamty—if they had not been discovered and treated.

Bicillin will help reduce the syphilis toll even more sharply. Dr. Shafer believes wider use of the substance is definitely on the way. He closed a recent interview with a hopeful look to the future: "If future tests confirm present results—and I know of no reason they shouldn't—it looks like the end of our search for a one-injection treatment for early syphilis."

**Amazing NEW Book** Shows You How You Can Build Any of 27 Different Structures . . for Mere Cost of Materials! 256 Pages, 207 Pictures, 23 Chapters!

> "How to Build Cabins and Ranch Houses" will slash the cost of your new home! This one great book shows how you can build it yourself at lowest possible cost from the foundation to the roof. And it's EASY! Just choose your favorite from the loads of illustrations (complete with floor plans) whether it be cabin, lake cottage, modern ranch house, or mountain retreat. With the aid of this brand-new, money-saving book, you'll complete your house in record time!

#### SIMPLIFIED DETAILS

You don't need professional belp when you start building your dream home. Here are simplified, detailed instructions on laying a foundation, building and caulking walls, constructing stairs, laying floor boards, estimating costs. Step-by-step plans on making windows, building fireplaces and chimneys, cutting doors, installing plumbing and lighting. You'll also find out bow to beautify your cabin or ranch house, prevent wood decay, build rustic furniture, and speed up the building with many short outs. Equip your house with all modern conveniences at a fraction of the usual cost!

#### BEND NO MONEY NOW!

Detach and mail coupon below, then pay postman the low, bargata price of \$2.49, plus a few cents postage, when your book arrives. Examine this wonder-book with its 256 pages, 207 illustrations, and sturdy cloth binding for a full week! Then, if you don't agree that you'd pay twice as much ordinarily for such a big, jam-packed book, simply return it for refund with NO OBLIGATION! But, HURRY-get your copy while they last!

Valuable section shows you

how to heald and sell road-

#### EDITORS' IMPARTIAL TESTS PROVE:

# New Self-Charging Battery Outlasts, Outperforms Others 221%

Afew months ago, we started producing a new battery which we frankly believe to be many years ahead of its time. When we announced that this new battery developed 15 amperes more power than other batteries and would suturnatically bounce back to life again and again after being deliberately and completely discharged, technical editors of leading magazines raised their syebrows.

When we added that we had named it the Lifetime Battery because of its life (meaning exceptional power) and the time it would last (3 to 4 times as long as ordinary batteries), and that we guaranteed it for air years, these editors were understandably doubtful, to put it mildly. One publisher, in fact, refused to accept advertising for this battery until what he then considered to be our extreme claims were carefully tested.

One of the editors said: "Let us test this hattery, any way we see fit. If it does what you claim, it's news our readers will be interested in. If it's no good, our readers will be interested in that, too, and that's the way we'll write the story." We said "go ahead" and they took a standard Lifetime Battery off the production line and went to work.

You may have read the result of the first test in a famous automotive magazine (name on request). Using two well-known batteries (possibly the best-known high-quality batteries in the world): for comparison, they first run the Lifetime Buttery down completely and let it re-charge itself automatically. They repeated this test 43 times the first day, then compared its strength with the other two batteries. Results: the Lifetime Battery was 2048 stronger than the strongest of the other two batteries. They discharged the Lifetime Battery another 20 times, allowing it to re-charge itself automatically each time, and compared all batteries again the Lifetime Battery was now 2135 stronger than one bettery, 2215 stronger than the other! Next, they put a punishing 300-amp load on the Lifetime Battery; it survived that in good shape. So they repeated the selfrecharging test again and finally concluded: "... unprecedented life expectancy . . . remarkable recuperative characteristics . . . outperformed the others in every respect and by a comfortable margin. an outstanding value.

The editor of another magazine (name on request) heard about the tests and asked to "give the thing a real test, one that would burn up the average bettery." We gave him the same buttery and challenged him to "finish it off." He installed it in his own car and drove the car on the buttery alone, shifting gears as he would normally, until his "fingers were sore from holding the starter key . . . I hate to admit it, but I was outlasted by a bettery."

Still another editor wrote: "... definite battery improvement... greater recuperative power, greater initial output—obviously high quality."

During Independent tests in Aloska and the U.S., the Lifetime Battery was intentionally discharged under sub-franzing conditions, recharged itself optomatically & started cut at once!

#### **Engineered for Cold Climates**

Soon after the Lifetime Battery went into production, we selected a few dealers in northern U.S. and Alaska, shipped them a few batteries and waited to see how the dealers and the public would react. Our Alaska dealer told us that before presenting it to his customers, he was going to give the battery an Arctic test: discharge it completely then freeze it at 30 below zero for 72 hours. Berult the battery had recharged itself and immediately started the car immediately we received a telegraphed order from Alaska for \$6,043 worth of Lifetime Batteries!

#### 6-Year Guarantee Savas Yeu Up to \$107

The average deline battery lasts 1.4 years at a typical cost of \$25.00, or \$107.00 for a 6-year period. This arithmetic is making sense to people who are tired of throwing money away on batteries that just won't hold up. We believe it will make sense to you, too—particularly since the Lifetime Battery you buy now can easily be transferred to your new car whenever you trade in.

#### 12-volt and 6-volt Available

Here's more arithmetic that makes sense: the Lifetime Buttery sells in the U.S. at one price for all cars: \$29.95 for 6-volt \$34.95 for 12-volt including excise tax.

#### Supply Limited: Order Today by Mail!

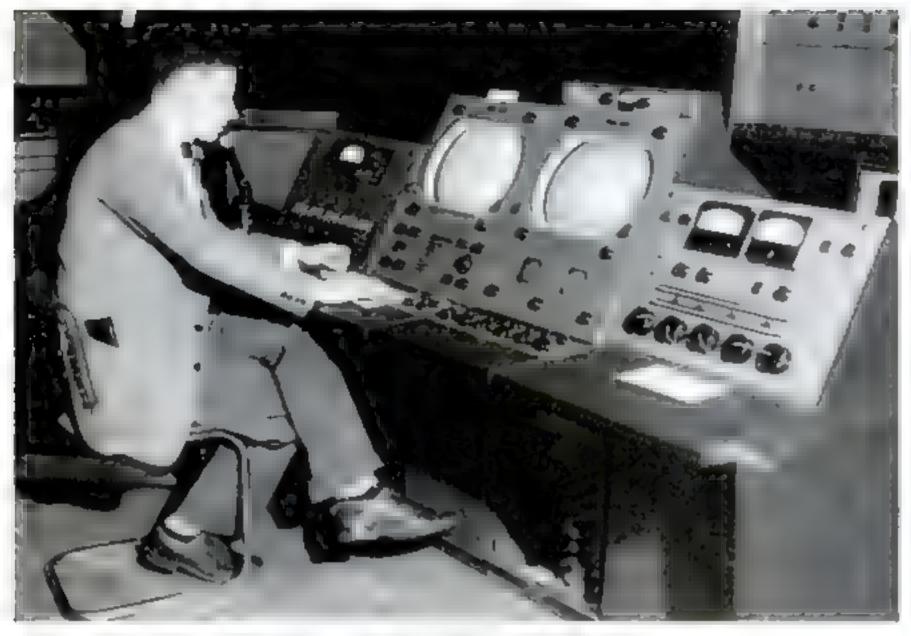

Although plant facilities are being expanded, supply is still imited. If your dealer can't supply you, order direct by mail from the factory, we pay freight.

#### One Man Can Operate a Complete TV Station

The man in the picture above is running a TV station all by himself. At his finger-tips on the switchboard are controls for the transmitter, slide and film projectors, audio and transmission facilities—and the big programs that come in from New York and Hollywood. The station is made in a pack-

age by GE, which says it costs only onequarter as much as today's average station, but can blanket a metropolitan area if given the power. GE engineers believe it will hasten the day when the 1,100 small cities recently allotted TV channels will actually get stations.

#### Smallest TV Studio Camera Costs One-Fourth as Much to Run

Mounting TV production costs will be whittled down a bit by the new studio camera being demonstrated by the Kinescope cutie in photo at left. Although it is 33 percent smaller than standard models, it is equally versatile, transmits a better picture, and costs only one-fourth as much to operate.

To let the cameraman concentrate on the artistic side of his job, all gadgets except the lens focusing and positioning controls have been removed from the camera and placed on a monitoring desk. Claude Neon, Inc. engineered the new design,
